# The 2018 Policy Report on Balanced Development of Human Resources for the Future 

Analysis of Global Gender Indices and Joint Survey Results from INWES APNN/ARN Member Countries

Kong-Ju-Bock Lee (Ewha Womans University)
Hye Young Park (Dongseo University)
Jung Sun Kim (Dongseo University)
Yang Hee Kim (Gender \& Leadership)

## Foreword

We have recently been exposed to the risks of social and economic inequalities. Gender inequality is certainly one of those risks. Women make up one half of the world's population. Hence it is fundamental that women must have equal access to education, health, economic and political representation. However, the reality is far from that; half of the world's human resources does not have equal opportunities. In the era of the fourth industrial revolution, it is urgently needed to accelerate progress towards gender equality for a sustainable human society.

This policy initiative series was launched in 2014, as part of the International Cooperation Policy Project of the Association of Korean Woman Scientists \& Engineers (KWSE). Korea is facing a rapidly aging society with an extremely low birth rate, which is expected to be the main factor hindering economic growth and national competitiveness. Despite this situation, only about half of the highly educated women in Korea participate in economic activities. Maximizing the utilization of highly educated women in all fields including science and engineering, hence, will be an utmost priority policy in Korea. We also would like to emphasize that the most efficient approach to the balanced development of human resources for the future comes from empowering women who make up more than half of the global population.

As reported in the previous researches, the well-known international indices related to human resources development by the United Nations Development Program (UNDP) and the World Economic Forum (WEF) are updated every even number of years. The indices are Human Development Index, Inequality-adjusted Human Development Index, Gender Development Index and the Global Gender Gap Index. Special analyses on status of human development are performed for 36 member countries of the Organization for Economic Co-operation and Development (OECD), 13 member countries of the Asia and Pacific Nations Network (APNN) and 12 member countries of the Africa Regional Network (ARN) under the International Network of Women Engineers and Scientists (INWES). According to the definition and purpose of each index, different measurement from each other is applied. As a result, the interpretation for each index could be diverse. However, these indices provide a rough comparison of the status of human resources development and gender equality around the world.

The second part of this report is dedicated to the results of the 2018 joint survey on the gender barriers in the fields of science and technology for 1,604 respondents from 12 countries of the APNN and 490 respondents from 3 countries of the ARN. The joint survey has been conducted since 2014 for women scientists and engineers of the APNN. Focusing on the gender barriers, the questionnaire was designed for women in 2016, for men in 2017, and for female and male students majoring in science and engineering in 2018. It is quite meaningful that the ARN member countries participated in this 2018 survey for the first time. In general, the APNN's respondents turned out to perceive more gender barrier and
to be more progressive in perception of gender role stereotype than the ARN's respondents. However, the ARN's respondents had more direct or indirect experiences of gender barrier and showed more positive career outlook than the APNN's respondents.

In the beginning of this research project, we hoped to lay a foundation to create an Asian "She Figures" which is a collection of statistics targeting gender innovation published by the EU every three years since 2003. We also aimed to serve as a useful reference in policy development for a full utilization of highly educated women scientists and engineers in the Asia-Pacific region. Change does come very slowly. However, such an effort is hoped to continue until balanced development of all human resources and complete gender equality come true.

November 20, 2018

## Acknowledgements

This report was made possible by the invaluable support of many people. We would like to take this opportunity to extend our sincere gratitude to everyone who participated in this policy study, provided data, analyzed statistical data from the survey and provided financial support. Our special thanks go to the survey participants, as well as to the international joint survey team who carried out the survey.

## Resources and Advice:

Byung-Joo Min (Former member of the National Assembly of Korea)
Kong-Joo Lee (Past President, INWES)
Hye-On Yoon (President, KWSE)

## Financial Support:

1) A representative to APNN/ARN or the person who carried out the survey.

APNN is the network of countries in the Asia-Pacific region under the INWES. Established in 2011, APNN currently has 15 member countries, including INWES's members in Asia (excluding the middle east) and the Pacific islands (Australia, Bangladesh, India, Japan, Korea, Malaysia, Mongolia, Nepal, New Zealand, Pakistan, Sri Lanka, Taiwan, Vietnam, and Australia and New Zealand.). Myanmar and the Philippines joined in 2018.
ARN was established in 2014 as the African Regional Network of INWES. Members include, 12 countries in the African continent excluding the North African countries. Members are from Algeria, Botswana, Burkina Faso, Cameroon, Ghana, Kenya, Liberia, Mali, Nigeria, Senegal, Tanzania, and Uganda

Note: ${ }^{* * *} p<.001,{ }^{* *} p<.01,{ }^{*} p<.05$
The questions are evaluated on a Likert-type scale ( 5 points).

1. Perception of Gender Barriers: Higher score means higher perception of gender barriers in STEM
2. Direct/Indirect Experience of Gender Barriers: Higher score means more experiences of gender barrier in STEM
3. Career Outlook for Women in STEM: Higher score means more positive prospect (reverse coded)
4. Need for policy to overcome 'gender barriers': Higher score means more agreement (reverse coded)

5 Perception of Gender Role Stereotype: The higher the score, the more progressive attitude towards gender role stereotype
6. Perception of Gender Equity: Higher score means higher perception or understanding of gender equity
7. Perception of Gender Barrier for study \& research environment: Higher score means higher perception (7-7 was reverse coded)

## 3) Survey on Gender barriers Among APNN \& ARN Member Countries: Average by Nation and by indicators

## Contents

Foreword ..... i
Acknowledgements ..... iii
Summary ..... iv

1. Introduction ..... 1
2. Current Status of Human Resources Development by Nation ..... 3
2.1 Human Development Index by the UNDP ..... 3
2.1.1 HDI composition and cross-country comparison ..... 3
2.1.2 Cross-country comparison of the IHDI ..... 6
2.1.3 Cross-country comparison of the GDI ..... 8
2.2 Gender Inequality Index by the UNDP ..... 10
2.2.1 GII composition ..... 10
2.2.2 Comparison of the GII among OECD member countries ..... 11
2.2.3 Comparison of the GII among APNN member countries ..... 12
2.2.4 Recent trends in Korea's GII ..... 14
2.2.5 Comparison of the GII among ARN member countries ..... 14
2.3 Summary on HDI, IHDI, GDI, and GII for APNN and ARN ..... 15
2.4 Global Gender Gap Index by the WEF ..... 17
2.4.1 GGI composition and data source ..... 17
2.4.2 Recent trends in subindices of the global GGI ..... 18
2.4.3 Comparison of the GGI among OECD member countries ..... 19
2.4.4 Comparison of the GGI among APNN member countries ..... 21
2.4.5 Recent trends in Korea's GGI ..... 22
2.4.6 Comparison of the GGI among ARN member countries ..... 25
3. Survey on Gender Barrier among APNN and ARN Member Countries ..... 28
3.1 Background ..... 28
3.2 The Survey ..... 28
3.2.1 Survey respondents, method and period ..... 28
3.2.2 Survey tool: Questionnaire composition ..... 29
3.2.3 Analysis of survey data ..... 29
3.2.4 The Questionnaire ..... 30
4. Results of the Survey on Gender Barrier ..... 34
4.1 General Respondent Profiles ..... 34
4.1.1 General Respondent Profiles of APNN member countries ..... 34
4.1.2 General Respondent Profiles of ARN member countries ..... 36
4.1.3 General Profiles of Respondent by Network ..... 38
4.1.4 General Profiles of Respondent by Country (APNN) ..... 39
4.1.5 General Profiles of Respondent by Country (ARN) ..... 47
4.2 Results from APNN ..... 51
4.2.1 Overall Results of APNN by Sub-area and by Country ..... 51
4.2.2 Analyses of Variables by sub-areas (APNN) ..... 57
4.3 Results from ARN ..... 72
4.3.1 Overall Results of ARN by Sub-area and by Country ..... 72
4.3.2 Analyses of Variables by sub-areas (ARN) ..... 78
4.4 Comparison of Results between APNN and ARN ..... 90
4.4.1 Comparing Responses between APNN and ARN by sub-area ..... 90
4.4.2 Comparing scores by sexes between APNN and ARN ..... 91
5. Conclusion and Suggestions ..... 100
References ..... 106
Appendix ..... 107
Appendix 1. Survey Results by Participating Country (APNN) ..... 108
A1.1 Nepal ..... 108
A1.2 New Zealand ..... 115
A1.3 Taiwan ..... 121
A1.4 Mongolia ..... 127
A1.5 Bangladesh ..... 133
A1.6 Vietnam ..... 139
A1.7 Sri Lanka ..... 145
A1.8 Japan ..... 151
A1.9 Pakistan ..... 157

2-1 The indicators of HDI ..... 4
2-2 HDI and its components by nation (2015) ..... 5
2-3 Korea's trends in HDI and its components (1990~2015) ..... 6
2-4 IHDI and its components by nation (2015) ..... 7
2-5 GDI and its components by nation (2015) ..... 9
2-6 The indicators of GII ..... 10
2-7 GII and its components for OECD (2015) ..... 11
2-8 GII and its components for APNN (2015) ..... 13
2-9 Recent trends of GII for APNN (2013~2015) ..... 13
2-10 GII trends in Korea from 2008 to 2015 ..... 14
2-11 GII and its components for ARN (2015) ..... 15
2-12 HDI, IHDI, GDI, and GII for APNN and ARN (2015) ..... 16
2-13 Structure of the global GGI ..... 17
2-14 The global snapshot of GGI (2017) ..... 18
2-15 GGI ranks and scores for OECD countries (2017) ..... 20
2-16 GGI ranks and scores for APNN countries (2017) ..... 21
2-17 GGI of APNN countries in 2014~2017 ..... 22
2-18 GGI evolution of Korea (2006~2017) ..... 23
2-19 GGI status of Korea (2011~2017) ..... 24
2-20 GGI ranks and scores for ARN countries (2017) ..... 25
2-21 GGI of ARN countries in 2014~2017 ..... 26
3-1 The Questionnaire form ..... 30
4-1 Profile of Respondents by Country from APNN ..... 35
4-2 Profile of Respondents by Country from ARN ..... 37
4-3 Respondent Profile by Network ..... 38
4-4 Respondent Profile by Country from APNN ..... 39
4-5 Respondent Profile by Country from ARN ..... 47
4-6 Summary of Results by sub-areas and by Country from APNN ..... 51
4-7 Summary of scores of individual questions of APNN ..... 52
4-8 Comparison of scores from Sub-area 1 by Personal Variable from APNN ..... 58
4-9 Analyses of Variables for Sub-area 1 (PGB, APNN) ..... 58
4-10 Comparison of scores from Sub-area 2 by Personal Variable from APNN ..... 59
4-11 Analyses of Variables for Sub-area 2 (EGB, APNN) ..... 59
4-12 Comparison of scores from sub-area 3 by Personal Variable ..... 61 from APNN
4-13 Analyses of Variables for Sub-area 3 (CO, APNN) ..... 61
4-14 Comparison of scores from sub-area 4 by Personal Variable from APNN ..... 63
4-15 Analyses of Variables for Sub-area 4 (NSP, APNN) ..... 63
4-16 Comparison of scores from sub-area 5 by Personal Variable from APNN ..... 65
4-17 Analyses of Variables for Sub-area 5 (PGS, APNN) ..... 65
4-18 Comparison of scores from sub-area 6 by Personal Variable ..... 67 from APNN
4-19 Analyses of Variables for Sub-area 6 (PGE, APNN) ..... 67
4-20 Comparison of scores from sub-area 7 by Personal Variable from APNN
4-21 Analyses of Variables for Sub-area 7 (PGB Env, APNN) ..... 69
4-22 Summary of Results by Sub-area and by Country from ARN ..... 72
4-23 Summary of scores of individual questions from ARN ..... 73
4-24 Comparison of scores from Sub-area 1 by Personal Variable from ARN
4-25 Analyses of Variables for Sub-area 1 (PGB, ARN) ..... 79
4-26 Comparison of scores from Sub-area 2 by Personal Variable ..... 80
4-27 Analyses of Variables for Sub-area 2 (EGB, ARN) ..... 80
4-28 Comparison of scores from Sub-area 3 by Personal Variable from ARN ..... 82
4-29 Analyses of Variables for Sub-area 3 (CO, ARN) ..... 82
4-30 Comparison of scores from Sub-area 4 by Personal Variable from ARN ..... 83
4-31 Analyses of Variables for Sub-area 4 (NSP, ARN) ..... 84
4-32 Comparison of scores from Sub-area 5 by Personal Variable from ARN ..... 85
4-33 Analyses of Variables for Sub-area 5 (PGS, ARN) ..... 85
4-34 Comparison of scores from Sub-area 6 by Personal Variable from ARN ..... 86

# Current Status of Human Resource Development in APNN and ARN 

## 1. Introduction

As low fertility rate and aging of population are getting worse, Korea has entered the aged society in 2017 and is estimated to enter the super-aged society in 2026, according to Statistics Korea. The aged society is defined by the elderly ( 65 or older) population exceeding $14 \%$ and the super-aged society by that exceeding $20 \%$. It took only 17 years to transit from the aging society, which is defined by the elderly population exceeding $7 \%$, to aged society and is expected to take 26 years from the aging to super-aged society in Korea. This transition rates are the fastest in the world, considering that it took 24 years in Japan to transit from the aging to the aged society and about 100 years in the United States and the United Kingdom to transit from the aging to the super-aged society. As a result, the economically actable population of ages from 15 to 64 was declined for the first time last year in Korea. It is no doubt that Korea's economy is facing great risks.

It is well-known that the educational heat of Korean parents is excessive. The excessive heat of education has caused many social problems, but it has also brought gender equality in education. According to the Global Gender Gap Report 2017 by the WEF, $96 \%$ of the gender gap in education attainment is closed in Korea. On the other hand, labour force participation rate turns out to be $55.9 \%$ for women, which is only $73 \%$ of the rate for men. The labour force participation rates for highly educated women and men are higher than the overall rates, as easy to expect. However, the gender gap in labour force participation rate becomes much wider for highly educated population than the one for the all economically active population. Interestingly, the negative factor provides the solution for the decline in Korean workforce, caused by rapid aging and low birth rate. The solution is certainly a sufficient utilization of highly educated women. It is regrettable that it has been a constantly proposed solution for the past decade but has not yet been fully realized. Nevertheless, we can not stop our efforts. It has been a highly challenging task to encourage highly educated women to participate more actively in economic activities. Social and structural inequalities in gender lie at the base of the low labour force participation rate of women. This research series continues to approach the social and structural issues using an analysis of international indices measuring human resources development and a survey on gender barriers, specially in science and engineering fields.

The current status of human resources development by country based on the aforementioned international indices is examined in Chapter 2. Our concern of the international indices related to human resources development are Human Development Index (HDI), Inequality-adjusted Human Development Index (IHDI), Gender Development Index (GDI) by the United Nations Development Program (UNDP) and the Global Gender Gap Index (GGI) by the World Economic Forum (WEF). Special analyses on status of human development are performed for 36 member countries of the Organization for Economic Co-operation and Development
(OECD), 13 member countries of the Asia and Pacific Nations Network (APNN) and 12 member countries of the Africa Regional Network (ARN) under the International Network of Women Engineers and Scientists (INWES). At the first time the analysis is classified for the ARN in this report and the analysis on those indices has been updated every two years since 2014.

Chapter 3 presents a summary of the survey on gender barrier in science and engineering fields among APNN and ARN member countries and Chapter 4 provides briefly the survey's overall results by key classification of questionnaire and country. The detailed analysis on each question are collected in the Appendix by country. 1,604 respondents participated from Bangladesh, India, Japan, Korea, Malaysia, Mongolia, Nepal, New Zealand, Pakistan, Sri Lanka, Taiwan and Vietnam, which are 12 out of 13 APNN member countries, and 490 respondents participated from Kenya, Nigeria and Uganda out of 12 ARN member countries. The ARN member countries participated in this 2018 survey for the first time. The joint survey within the APNN has been conducted since 2014. Focusing on the gender barriers since 2016, the questionnaire was asked for women in 2016, for men in 2017, and for female and male students majoring in science and engineering in 2018. The gender barrier refers to the existence and experiences of gender discrimination that function as hindrances to gender equality. This includes institutional or customary barriers and conscious or unconscious barriers. Specific examples are traditional gender role stereotypes, unfairness in employment and promotion, work-life balance and responsibility for family and other unfair treatment. To access gender barriers in STEM fields, the survey was broadly classified into perception of gender barriers, direct or indirect experience of gender barriers, perception on policy to overcome gender barriers, perception of gender equality and perception of gender equality for study and research environment. Three consecutive surveys on the same subject for different respondent sectors such as women professionals, men professionals and future professionals in science and engineering fields are expected to suggest meaningful results. The joint survey has been opening up more opportunities for countries in the Asia-Pacific region and now in the Africa region to share methods of nurturing and utilizing female scientists and engineers. This report closes in Chapter 5 with conclusion and suggestions.

## 2. Current Status of Human Resources Development by Nation

This chapter provides a brief overview of human development based on the Human Development Report 2016 by the UN and the Global Gender Gap Report 2017 by the WEF. We summarize, for this purpose, all the composite indices of the Human Development Index (HDI), the Inequality-adjusted Human Development Index (IHDI), the Gender Development Index (GDI), the Gender Inequality Index (GII), and the Gender Gap Index (GGI). The current status of human resources development is reviewed among the member countries of the OECD, APNN INWES, and ARN INWES through these indices. Such an analysis has been done every two years since 2014. The description for the composite indices are not changed as before, however, this report of 2018 includes the IHDI for the first time in our analysis. The status of human development among the member countries of the ARN INWES is also reviewed for the first time since the ARN participates in the KWSE survey 2018 on the gender barrier.

The UNESCO Institute for Statistics (UIS) presents regional profiles of women in science according to the latest data. We will also briefly review the UIS data on women scientists in all fields and only in STEM. The USI offers wonderful visualization about the latest data for the countries around the world in this link,
http://uis.unesco.org/apps/visualisations/women-in-science/\#overview!view=map\&regi on=40515.

### 2.1 Human Development Index by the UNDP

### 2.1.1 HDI composition and cross-country comparison

The "technical notes" of the Human Development Report 2016 describes that the Human Development Index (hereinafter referred to as "HDI") is a summary measure of achievements in three key dimensions of human development: a long and healthy life, access to knowledge and a decent standard of living. For the health dimension, life expectancy is chosen as an indicator. For the education dimension, expected years of schooling and mean years of schooling are chosen as indicators. Gross national income per capita is the indicator for the standard living dimension. Data sources for the measurement are from UNDESA (2015), UIS (2016), UNICEF, IMF (2016), UNSD (2016), and World Bank (2106). The HDI is designed to have a value between 0 and 1 ; the higher HDI translates to the greater achievement in human development. To transform the indicators on a scale of 0 to 1 , minimum and maximum values are set as in the Table 2-1. The dimension indices are calculated as:

$$
I=\frac{\text { actual value }- \text { minimum value }}{\text { maximumvalue }- \text { minimum value }} .
$$

For the education dimension which has two indicators, the arithmetic mean is
taken. Then the HDI is calculated as the geometric mean of the three dimension indices: $H D I=\left(I_{\text {Health }} I_{\text {Education }} I_{\text {Income }}\right)^{1 / 3}$.
<Table 2-1 The indicators of HDI>

| Dimension | Indicator | Min | Max | Description |
| :---: | :---: | :---: | :---: | :--- |
| Health | Life expectancy | 20 | 85 | Life expectancy at birth assuming that the <br> death rate will be maintained as when one <br> was born |
| Education | Expected years of <br> schooling | 0 | 18 | Years that a 5-year-old child will spend <br> with his education in his whole life |
|  | Mean years of <br> schooling | 0 | 15 | Years that a 25-year-old person or older has <br> spent in schools |
| Standard <br> of living | Gross national income <br> per capita (2011 PPP \$) | 100 | 75,000 | Measured based on Purchasing Power <br> Parity (PPP) |

According to the following cutoff values of the HDI, 188 countries divide into four groups: very high human development for $H D I \geq 0.800$, high human development for $0.799 \geq H D I \geq 0.700$, medium human development for $0.699 \geq H D I \geq 0.550$, and low human development for $H D I<0.550$. Table 2-2 presents the country ranks by 2015 HDI values and the values of four HDI indicators for several countries in each group. The APNN member countries are shaded and the ARN member countries are check-shaded in the table.

Norway's rank of HDI value is 1 out of 188 countries, topping the list of countries for the $13^{\text {th }}$ consecutive year. The HDI value of Norway, 0.949 is significantly larger than both the average of 0.892 for very high human development group and the average of 0.887 for OECD countries. Compared to Norway's HDI value of 0.849 for 1990, there was an increase of $11.8 \%$ between 1990 and 2015.

Australia which is one of the APNN member countries follows Norway in the list with the HDI value of 0.939 . Among the APNN member countries shaded (orange in color-version) in Table 2-2, Australia, New Zealand, Japan and Korea are in the group of very high human development. Japan's HDI value is 0.903 ranked at 17 and increased $1.35 \%$ compared to the value for 2014. Korea's HDI value is 0.901 ranking it at 18 . The value increased from 0.731 to 0.901 between 1990 and 2015 which was an increase of $23.3 \%$. Table 2-3 shows Korea's HDI trends since 1990. It is noticeable that the GNl per capita increased by $186.3 \%$ for 25 years. Malaysia, Sri Lanka and Mongolia are in the group of high human development. Nepal and Pakistan, which belonged to the group of low human development in 2014, moved up to the group of medium human development in 2015.

Among the ARN member countries, Algeria's HDI value is highest and grouping in the high human development. Botswana, Ghana and Kenya positioned in the group of medium human development.
<Table 2-2 HDI and its components by nation (2015)>
(HDI=1: highest human development)

| Rank <br> /188 | Country | HDI <br> value | Life expectancy at birth (years) | Expected years of schooling (years) | Mean years of schooling (years) | Gross National Income per capita (2011 PPP \$) |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Very high human development ( $H D I \geq 0.800$ ): average HDI value of $\mathbf{0 . 8 9 2}$ |  |  |  |  |  |  |
| 1 | Norway | 0.949 | 81.7 | 17.7 | 12.7 | 67,614 |
| 2 | Australia | 0.939 | 82.5 | 20.4 | 13.2 | 42,822 |
| 2 | Switzerland | 0.939 | 83.1 | 16.0 | 13.4 | 56,364 |
| 4 | Germany | 0.926 | 81.1 | 17.1 | 13.2 | 45,000 |
| 5 | Denmark | 0.925 | 80.4 | 19.2 | 12.7 | 44,519 |
| 5 | Singapore | 0.925 | 83.2 | 15.4 | 11.6 | 78,162 |

### 2.1.2 Cross-country comparison of the IHDI

The Inequality-adjusted HDI (hereinafter referred to as "IHDI") was introduced in the Human Development Report 2010 to take into account inequality in all three dimensions of the HDI. Following the report, the inequality measure $(A)$ is defined as a deviation of the ratio of geometric mean $(g)$ to arithmetic mean $(a)$ of the distribution from $1(A=1-g / a)$. The IHDI is then defined as the geometric mean of the three dimensions adjusted by the inequality measures, $\quad I H D I=\left[\left(1-A_{\text {Health }}\right)\left(1-A_{\text {Education }}\right)\left(1-A_{\text {Income }}\right)\right]^{1 / 3} H D I$. Hence the IHDI shows how the average achievements in human development of a country are distributed among its residents. The ' $\operatorname{loss}(\%)$ ' due to inequality is given by $(H D I-I H D I) / H D I \times 100$. Note that the IHDI does not avoid overlapping inequality.

Table 2-4 contains the IHDI value and the loss due to inequality for the countries in Table 2-2. Norway's rank of IHDI value is still 1 out of 151 countries, not changed from the rank of HDI value. The $2^{\text {nd }}$ rank is positioned by Iceland with a loss of only $5.8 \%$ due to inequality. Iceland's rank of HDI value is 9 out of 188. The average loss due to inequality for the group of very high human development is $11.1 \%$ which is slightly less than $12.6 \%$ for OECD. Korea's IHDI for 2015 is 0.753 . Comparing to HDI of 0.901 yields a serious loss of $16.4 \%$ due to inequality in human development. Japan shows a loss of $12.4 \%$ which is about the average for OECD.

The average loss for the APNN member countries turns out to be $19.3 \%$. Among the APNN member countries, Australia takes the least loss of $8.2 \%$ and Sri Lanks follows next with the loss of $11.6 \%$. The average loss of $32.8 \%$ is for the ARN member countries revealing a significant inequality in human development. The least loss due to inequality among the ARN member countries comes to Tanzania with the loss of $25.4 \%$.

### 2.1.3 Cross-country comparison of the GDI

The Gender Development Index (hereinafter referred to as GDI) is a measure of gender inequality in three dimensions of the HDI and defined simply as the ratio of female HDI to male HDI. Hence $G D I=H D I_{\text {female }} / H D I_{\text {male }}$. According to the absolute deviation of GDI from 1 which means 'gender parity', $d(\%)=|1-G D I| \times 100$, countries are classified in five groups. Group 1 of high equality is for $d \leq 2.5 \%$, group 2 of medium-high equality for $2.5 \%<d \leq 5 \%$, group 3 of medium equality for $5 \%<d \leq 7.5 \%$, group 4 of medium-low equality for $7.5 \%<d \leq 10 \%$, group 5 of low equality for $d>10 \%$.

The GDI is calculated for 160 countries in 2015. The GDI values and groups for the same countries in Table 2-2 are listed in Table 2-5. Most countries achieved the very high human development in the HDI are classified as the groups 1 and 2 in the GDI. Exceptions are Saudi Arabia that is classified as the group 5, Malta as group 4, Netherlands and Korea as group 3. It is worth to comment on Finland that is not included in Table 2-5. Finland's HDI rank is 23 with 0.895 of the HDI value, but the GDI value is perfectly one indicating no absolute deviation from gender parity. Poland, Latvia, Mongolia, and Viet Nam in the table show the GDI values larger than 1, hence $H D I_{\text {female }}>H D I_{\text {male }}$ for those countries unlike others. Interestingly, the absolute deviation (d) is larger than $2.5 \%$ for Latvia and Mongolia classified as the group 2. In all countries, the GNI for female is much less than the GNI for male as easily expected.

Despite its 18th position in the HDI, Korea is classified as the group 3 in GDI, indicating that female HDI value 0.863 is much lower than male HDI value 0.929 . The absolute deviation for Korea is $d=7.1 \%$ that is much higher than $d=3.0 \%$ for Japan. Mean years of schooling for female, 11.5 years, are significantly shorter than those for male, 12.9 years in Korea. Expected years of schooling in Korea are also shorter for female ( 15.8 years) than for male (17.3 years). Considering that almost every countries in very high human development show longer years of schooling for female than for male, the situation in Korea amazingly reveals the gender inequality in education dimension.

Among the APNN member countries, India and Pakistan are classified as the group 5 in GDI with the absolute deviation $d=18.1 \%$ and $d=25.8 \%$, respectively. Nepal is in the border of group 4 with $d=7.5 \%$. Bangladesh with the absolute deviation $d=7.3 \%$ and Sri Lanka with $d=6.6 \%$ are also classified as the group 3 like Korea. For Mongolia and Viet Nam, as mentioned above, the female HDI values exceed the male HDI values. The absolute deviation $d=1.0 \%$ is for Viet Nam positioning in the group 1, on the other hand, $d=2.6 \%$ is for Mongolia positioning in the group 2.

Most of the ARN member countries are classified as the group 5 in the GDI indicating not only poor human development but also severe gender inequality in human development. Botswana is exceptionally classified as the group 1 with the absolute deviation $d=1.6 \%$.

APNN member countries
ARN member countries

As mentioned above, Korea's HDI value belongs to the group of very high human development, but the gender inequality in the HDI turns out to be strikingly severe even in education dimension. Examining more indices regarding the gender inequality could lead to some effective policies to reduce the gender gap. For this purpose the Gender Inequality Index (hereinafter referred to as GII) by the UNDP and the Gender Gap Index (hereinafter referred to as GGI) by the WEF will be reviewed in the following two sections.

### 2.2 Gender Inequality Index by the UNDP

The GII was introduced by the UNDP in 2010 in order to improve the shortcomings of the GDI and the Gender Empowerment Measure (GEM). The GDI was briefly reviewed in the previous section and the GEM, which was not mentioned specifically, is an index reflecting female participation in political activities and decision-making, economic activities and decision-making, and female share of income. The GEM is not treated here, but this section examines the GII composition and the current status of member countries of the OECD, the APNN, and the ARN.

### 2.2.1 GII composition

The GII consists of three dimensions and five indicators as listed in Table 2-6. Three dimensions measuring gender inequality are reproductive health, empowerment and the labour market. Two indicators of the maternal mortality ratio and adolescent birth rate measure the reproductive health. Empowerment is measured also by two indicators of the female share of seats in parliament and the male and female populations with at least some secondary education. The indicator of the labour force participation rate by gender measures the labour market dimension. The higher GII value indicates the greater inequality between men and women.

Note that the GII does not include income as one of the indicators and is designed to have the higher values for indicators that present the higher correlation to gender inequality. These are sometimes pointed out as a weakness of the GII.
<Table 2-6 The indicators of GII>

| Dimension | Indicator | Description |
| :---: | :---: | :--- |
| Reproductive <br> Health | Maternal mortality ratio | Number of deaths due to pregnancy-related causes per <br> 100,000 live births |
|  | Adolescent birth rate | Number of births to women ages 15~19 per 1,000 <br> women ages 15~19 |
|  | Share of seats in parliament | Proportion of seats held by women in the national <br> parliament expressed as percentage of total seats |
| Population with at least some <br> secondary education | Percentage of the population ages 25 and older that <br> has reached (but not necessarily completed) a <br> secondary level of education <br> Market | Labour force participation rate |
| Proportion of the working-age population (ages 15 and <br> older) that engages in the labour market, either by <br> working or actively looking for work expressed as a <br> percentage of the working-age population |  |  |

### 2.2.2 Comparison of the GII among OECD member countries

The GII can be understood as the loss in human development due to gender inequality. Table 2-7 presents the GII status of the OECD member countries in 2015. The GII takes a value between 0 and 1 , with 0 meaning complete gender equality and with 1 meaning complete gender inequality.
<Table 2-7 GII and its components for OECD (2015)>

| Average |  | OECD | 0.194 | 15 | 22.4 | 27.7 | 84.2 | 86.9 | 51.1 | 68.6 |

${ }^{\text {a) }}$ Lithuania became a full member of the OECD since July 2018 so that the number of member countries is now 36 .
${ }^{\text {b }}$ Data refer to the most recent year available during 2005~2015.

Compared to 2014, the GII values and ranks for Slovenia, Germany and Austria are significantly changed in 2015 . The GII values for Slovenia, Germany
and Austria are increased from 0.016 to 0.052 , from 0.041 to 0.066 and from 0.053 to 0.078 , respectively. Also the GII ranks for Slovenia, Germany and Austria are dropped from 1 to 6 , from 3 to 9 and from 5 to 14 . Interestingly, these countries showed increased adolescent birth rates in 2015 compared to 2014. For instance, the adolescent birth rate of Slovenia is increased from 0.6 in 2014 to 3.8 in 2015.

Korea's GII value is greatly lowered from 0.125 , positioning 23th among 155 countries in 2014, to 0.067 , ranking 10th among 159 countries and also among 36 OECD countries in 2015 . This value, 0.067 is much lower than the average value, 0.194 of the OECD and the average value, 0.174 of the group of very high HDI. The reason for reducing the loss in human development due to gender inequality turns out to be a significantly reduced maternal mortality ratio from 27 to 11. The maternal mortality ratio is defined as the annual number of female deaths per 100,000 live births due to any cause related to pregnancy. Korea's maternal mortality ratio was very high among the OECD member countries for a long time. It is needed to closely monitor the future trend to analyze whether Korea's maternal mortality ratio in 2015 is peculiar and spontaneous or not. Though the overall GII value presents the gender inequality reduced in Korea, female participation in the labour market is still only $50.0 \%$ compared to $71.8 \%$ for men.

Latvia which became a member of the OECD in 2016 and Lithuania which became a member in 2018 have GII values of 0.191 and 0.121 , respectively. The GII ranks of Latvia and Lithuania among OECD member countries are 41 and 23, respectively. In Finland, Canada and Estonia, amazingly, all female and male population ages 25 and older have reached a secondary level of education.

### 2.2.3 Comparison of the GII among APNN member countries

Table 2-8 shows the GII status of the APNN member countries, in increasing order of gender inequality, in 2015. Recent trends of the GII values and ranks for three year are also listed in Table 2-9. As mentioned above, Korea's GII value is reduced significantly in 2015 so that it is the lowest among the APNN member countries. Although the rapidly decreased maternal mortality ratio is the main reason for the low value of the GII, the maternal mortality ratio for Korea is higher than the ratio for Japan. Japan's GII value is steadily decreasing with very low maternal mortality ratio. The female labour force participation rates for Korea and Japan are $50.0 \%$ and $49.1 \%$, respectively. The male labour force participation rates for Korea and Japan are $71.8 \%$ and $70.2 \%$, respectively. Hence the participations in labour market for both countries are very similar. Mongolia's GII can be analyzed as a decreasing trend recent years. On the other hand, Malaysia' GII is increased abruptly in 2015 compared to in 2014.

The adolescent birth rates for Vietnam, Pakistan, Nepal and Bangladesh are $38.6,38.7,71.9$ and 83.0 , respectively. Most countries of the APNN show also very large maternal mortality ratio. For instance, in Nepal, 258 women die from pregnancy related causes for every 100,000 live births. Bangladesh, India
and Pakistan show more than 170 deaths due to pregnancy related causes. The percentages of parliamentary seats held by women are relatively high in New Zealand, Australia, Nepal and Vietnam with $31.4 \%, 30.5 \%, 29.5 \%$ and $24.3 \%$, respectively. In Korea, only $16.3 \%$ of parliamentary seats are held by women. Nepal and Vietnam show high female participation rates in labour market which are $79.7 \%$ and $73.8 \%$, compared to $86.8 \%$ and $83.2 \%$ for men, respectively. In this analysis, Taiwan's data is not compared to other member countries because they are measured by Taiwanese government based on the UNDP methodology.

### 2.2.4 Recent trends in Korea's GII

Korea's GII values and ranks have been a zig-zag pattern, as shown in Table 2-10, but overall, the gender inequality tends to be lower. The maternal mortality ratio and the adolescent birth rate have been reduced. The female share of seats in parliament has been slowly increased, and yet it is much less than the average percentages for the OECD and the UN member countries.
<Table 2-10 GII trends in Korea from 2008 to 2015>

| Year | GII |  | Reproductive Health |  | Empowerment |  |  | Labour Market <br> Labour force participation rate |  |

| 2015(UN) | - | 0.443 | 216 | 44.7 | 22.5 | 60.3 | 69.2 | 49.6 | 76.2 |

(Source: UNDP Human Development Report 2010~2016)

The female population with at least some secondary education for Korea is $88.8 \%$, which is higher than $84.2 \%$, the average of the OECD member countries and much higher than $60.3 \%$, the average of the UN countries. On the other hand, the female labour force participation rate for Korea, $50.0 \%$, is about the average rates for the OECD and the UN countries. It can be interpreted as highly educated Korean women are not actively participating in the labour market. Note that the dimension of labour market for Korea does not show any improvement in gender equality, compared to other dimensions.

### 2.2.5 Comparison of the GII among ARN member countries

Table 2-11 shows the GII status of the ARN member countries, in increasing order of gender inequality, in 2015. The average of the ARN's GII is 0.545 . Algeria and Botswana show relatively low values of 0.429 and 0.435 , respectively. In Botswana, $85.1 \%$ of women have reached at least some secondary education compared to $86.7 \%$ of men. All the ARN member countries except Botswana show quite low female and male populations with at least some secondary education. The average populations with at least some secondary education of the ARN are $27.9 \%$ for women and $36.0 \%$ for men. On the other hand, the labour force participation rates turn out to be relatively high. The average rates of the labour force participation are $61.1 \%$ for women and $77.1 \%$ for men. It is very peculiar that female participation in the labour market is only $16.8 \%$ compared to $70.4 \%$ for men in Algeria. The highest female participation in the labour market among the ARN is $82.3 \%$ marked by Uganda.
<Table 2-11 GII and its components for ARN (2015)>

| UN rank /159 | ARN rank /13 | Country | GII <br> value | Maternal mortality ratio | Adolescent birth rate | Share of seats in parliament \% held by women | Population with at least some secondary education |  | Labour force participation rate |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  |  |  |  |  |  | Female | Male | Female | Male |
| 94 | 1 | Algeria | 0.429 | 140 | 10.6 | 25.7 | 34.1 | 35.7 | 16.8 | 70.4 |

| 135 | 7 | Kenya | 0.565 | 510 | 90.9 | 20.8 | 27.8 | 34.1 | 62.1 | 72.1 |
| 138 | 8 | Cameroon | 0.568 | 596 | 104.6 | 27.1 | 31.7 | 37.9 | 71.0 | 81.1 |
| 146 | 9 | Burkina Faso | 0.615 | 371 | 108.5 | 9.4 | 6.0 | 11.5 | 76.6 | 90.7 |
| 150 | 10 | Liberia | 0.649 | 725 | 108.8 | 10.7 | 17.3 | 39.7 | 58.0 | 63.9 |
| 156 | 11 | Mali | 0.689 | 587 | 174.6 | 8.8 | 7.3 | 16.2 | 50.1 | 82.3 |
| - | - | Nigeria | - | 814 | 110.6 | 5.8 | - | - | 48.4 | 64.0 |
| Average |  | ARN | 0.545 | 437 | 93.0 | 20.2 | 27.9 | 36.0 | 61.1 | 77.1 |

(Source: UNDP Human Development Report 2016)
All the ARN member countries exhibit very high adolescent birth rates and maternal mortality ratios. The average adolescent birth rate is 93.0 births per 1,000 women of ages $15-19$. On average 437 women die from pregnancy related causes for every 100,000 live births. Algeria and Botswana show much lower adolescent birth rate and maternal mortality ratio among the ARN. 20.2\% of parliamentary seats are held by women on average and it is lower than the UN average $22.5 \%$ and the OECD average $27.7 \%$ but higher than Korea's $16.3 \%$. In Senegal, $42.7 \%$ of parliamentary seats are held by women, while only $5.8 \%$ of parliamentary seats are held by women in Nigeria.

### 2.3 Summary on HDI, IHDI, GDI, and GII for APNN and ARN

Sections 2-1 and 2-2 examined four specific indices on human resources development reported by the UNDP, which are Human Development Index, Inequality-adjusted Human Development Index, Gender Development Index, and Gender Inequality Index. Current status of human resources development for the APNN and the ARN member countries measured by these four indices is summarized in Table 2-12.

Most countries of low HDI values show relatively large loss in human development due to inequality, low GDI values indicating that female HDI is less than male HDI, and high GII values measuring high gender inequality. As pointed out previously, Korea has an individual human development higher than those of many other countries, however, the loss in human development due to inequality is quite high. Korea's GDI is also low positioning in the group 3. Among the APNN and the ARN member countries, Australia, Vietnam and Botswana positioned in the group 1 of GDI. The status of GDI is not parallel
to the status of GII. For instance, Australia placed in the group 1 of GDI is ranked at 24 in GII, while Korea placed in the group 3 of GDI is ranked at 10 in GII. As mentioned before, the GDI is simply the ratio of female HDI value to male HDI value so that it could not be seriously understood as the status of gender equality in human development.

${ }^{\text {a) }}$ IHDI $=$ Inequality-adjusted Human Development Index
${ }^{\text {b) }}$ Loss due to inequality $(\%)=(H D I-I H D I) / H D I \times 100$.
${ }^{\text {c) }}$ Group 1 is for $x \leq 2.5$, Group 2 for $2.5<x \leq 5.0$, Group 3 for $5.0<x \leq 7.5$, Group 4 for $7.5<x \leq 10.0$, and Group 5 for $10.0<x$, where $x=|G D I-1| \times 100$ is the absolute deviation of GDI from gender parity.
${ }^{\text {d) }}$ Bangladesh has been an INWES APNN member country since 2015.
e) Taiwan's data were determined by the Taiwanese government based on the UNDP and WEF methodology. (source: http://eng.stat.gov.tw/ct.asp?xItem=25280\&ctNode=6032\&mp=5)

### 2.4 Global Gender Gap Index by the WEF

The GGI, reported by the World Economic Forum every year, measures gender gaps in economy, education, health and politics for each country. Measuring the GGI is to focus on closing the gender gap in a country rather than on improving female rights and empowerment as the GDI and GII by the UNDP. In this section the composition of the GGI is discussed and the GGI values among different sectors are compared to each other.

### 2.4.1 GGI composition and data source

Table 2-13 summarizes the structure of the global GGI consisting of four subindices and fourteen variables. All variables except wage equality measure the ratios of female value over male value.
<Table 2-13 Structure of the global GGI>

| Subindex | Variable | Weight | Source |
| :---: | :---: | :---: | :---: |
| Economic Participation and Opportunity | Ratio: female labour force participation over male value | 0.199 | International Labour Organization |
|  | Wage equality between women and men for similar work (normalized on a 0 -to- 1 scale) | 0.310 | World Economic Forum |
|  | Ratio: female estimated earned income over male value | 0.221 | World Economic Forum |
|  | Ratio: female legislators, senior officials and managers over male value | 0.149 | International Labour Organization |
|  | Ratio: female professional and technical workers over male value | 0.121 | International Labour Organization |
|  | Weight Total | 1 |  |
| Educational <br> Attainment | Ratio: female literacy rate over male value | 0.191 | UNESCO Institute for Statistics |
|  | Ratio: female net primary enrolment rate over male value | 0.459 | UNESCO Institute for Statistics |
|  | Ratio: female net secondary enrolment rate over male value | 0.230 | UNESCO Institute for Statistics |
|  | Ratio: female gross tertiary enrolment ratio over male value | 0.121 | UNESCO Institute for Statistics |
|  | Weight Total | 1 |  |
| Health and Survival | Sex ratio at birth (converted to female-over-male ratio) | 0.693 | Central Intelligence Agency |
|  | Ratio: female healthy life expectancy over male value | 0.307 | World Health Organization |
|  | Weight Total | 1 |  |
| Political Empowerment | Ratio: females with seats in parliament over male value | 0.310 | Inter-Parliamentary Union |
|  | Ratio: females at ministerial level over male value | 0.247 | Inter-Parliamentary Union |
|  | Ratio: number of years of a female head of state (last 50 years) over male value | 0.443 | World Economic Forum |
|  | Weight Total | 1 |  |

(source: UNDP Human Development Report 2016, WEF Global Gender Gap Report 2017)

The Global Gender Gap Report 2017 emphasizes three underlying concepts on the global GGI. First of all, the GGI measures gender gaps rather than levels by intentionally dissociating the index from countries' levels of development. As the second concept, the report points that the GGI captures gaps in outcome variables rather than gaps in input variables. The input variables are indicators related to country-specific policies, rights, culture or customs, while economic participation, education, health and political empowerment are the outcome variables. Finally, the GGI ranks countries according to gender equality rather than women's empowerment. This means that the case of women outperforming men are treated the same as the case of outcomes for women equal to those for men. Hence the case of women outperforming men are neither rewarded nor penalized.

The subindex of economic participation and opportunity consists of five indicators measuring the gender gaps in participation, remuneration and advancement. Education attainment subindex captures the gender gaps in current access to education and literacy rate. In health and survival category, the sex ratio at birth and the gender gap in life expectancy are measured. The subindex of political empowerment measuring the gender gaps in ministerial positions, parliamentary positions and prime minister or president is certainly not capturing the gender gap at local levels of government. As seen in Table 2-13, the variables in each subindex possess different weights. For instance, the variable of wage equality between women and men for similar work is much more weighted than the variable of female professional and technical workers over male value in the category of economic participation and opportunity. The variable of female net primary enrolment rate over male value and the variable of sex ratio at birth are most highly weighted in categories of education attainment and health and survival, respectively.

### 2.4.2. Recent trends in subindices of the global GGI

The Global Gender Gap Report 2017 covers 144 countries and Table $2-14$ shows a global snapshot of the GGI on average. The gap of $68 \%$ is closed worldwide across the four subindices. It means that a gap to be closed is $32 \%$, which is slightly higher than $31.7 \%$ of the gap in last year. The gap to be closed in health and survival subindex is only $4 \%$, unchanged since last year. The gap between men and women in education attainment is about $5 \%$ which is slightly decreased from last year. However, only $58 \%$ of the economic participation and opportunity gap and $23 \%$ of the political empowerment gap have been closed. Moreover the economic participation and opportunity gap has been reversely progressed for two consecutive years.
<Table 2-14 The global snapshot of GGI (2017)>

| 144 <br> countries | GGI | Economic Participation and <br> Opportunity | Education <br> Attainment | Health and <br> Survival | Political <br> Empowerment |
| :--- | :---: | :--- | :---: | :---: | :---: |
| Gap to be <br> closed (\%) | 32 | 42 | 5 | 4 | 77 |

(source: WEF Global Gender Gap Report 2017)

Since the first edition of the Global Gender Gap Report was published in 2006, 106 countries have consistently been participated in the index. Figure 2-1 shows the yearly changes in the GGI and its subindices based on those 106 countries' data. The Report 2017 expects that it takes 100 years to close the overall global gender gap, under current conditions and trends. The time to close the education attainment gap is estimated as 13 years. The gender gap in the political empowerment is widest but shows the most progress last decade. On current trends, it could be 99 years to close the political empowerment gap. The worst thing happens in the economic dimension. The economic gender gap widens continuously since 2013 and the gap in 2017 has reverted back to that in 2008. In this trends, the economic gender gap is expected to take 217 years to be closed. Interestingly, the Report 2017 says that the time to close the gap in health and survival subindex remains undefined.
<Figure 2-1 Global GGI and subindices evolution (2006~2017)>

(source: WEF Global Gender Gap Report 2017, Figure 6)

### 2.4.3. Comparison of the GGI among OECD member countries

Table 2-15 presents the 2017 GGI of 36 OECD member countries with rankings and scores for each dimension. The rankings are based on 144 countries. The GII rankings reported by the UNDP among 159 countries are also provided to emphasize the importance of index design and concept. As previously mentioned, the GGI measures gender gaps in each country rather than levels. Hence the GGI is intentionally dissociated from countries' levels of development. On the other hand, the GII measurement is strongly associated with the countries' levels of development. The biggest discrepancy between the GGI and the GII ranks occurs in Korea, which ranks at 10 in the GII but at 118 in the GGI.
<Table 2-15 GGI ranks and scores for OECD countries (2017)>

| $\begin{gathered} \text { GII } \\ \text { UN } \\ \text { Rank } \\ / 159 \end{gathered}$ | $\begin{gathered} \text { GGI } \\ \text { OECD } \\ \text { Rank } \\ 136^{\mathbf{a}} \end{gathered}$ | Country | $\begin{gathered} \text { GGI } \\ (/ 144) \end{gathered}$ |  | Economic Participation and Opportunity |  | Education Attainment |  | Health and Survival |  | Political <br> Empowerment |  |

${ }^{\text {a }}$ Lithuania became a full member of the OECD since July 2018 so that the number of member countries is now 36.
(Source: WEF Global Gender Gap Report 2017)
Seven countries among the OECD members are positioned in the top 10 list of the world GGI. These top countries perform outstandingly on the political empowerment compared to both the world and the OECD averages. Top five countries in the Table $2-15$ show that more than $80 \%$ of their gender gaps are closed. Iceland has been the first for nine years in a row, closing almost $88 \%$ of the overall gender gap. Closing $75 \%$ of the political empowerment gap in Iceland is quite remarkable, if considering that only $57.6 \%$ of the gap in the next top country (Nicaragua) is closed.
$75 \%$ of the OECD members have a remaining gender gap of less than $30 \%$ and about $47 \%, 17$ countries, have fully closed the gap in the education attainment subindex. Among these 17 countries, Czech Republic, Latvia, Lithuania, Slovakia (officially Slovak Republic) and Slovenia are amazingly positioned at the first rank on both the health and survival subindex and the education attainment subindex. On the other hand, four countries, which are Hungary, Japan, Korea and Turkey, mark the rankings below 100, yielding a large discrepancy between the GII and the GGI. These four countries show much wider gaps in all subindices than the OECD average, except Japan's health and survival gap.

### 2.4.4. Comparison of the GGI among APNN member countries

The 2017 GGI of 13 APNN member countries with rankings and scores for each dimension are listed in Table 2-16. New Zealand performs best as usual by closing the overall gender gap up to $79 \%$ and by closing $43 \%$ of the political empowerment gap. Australia fully closed the gender gap in education attainment subindex, but only $23 \%$ is closed in the gap of political empowerment subindex. Japan, Mongolia and Sri Lanka are positioned at the first rank in the health and survival subindex by closing $98 \%$ of the gap. Japan and Korea show a very similar characteristics that they perform outstandingly in the GII but very poorly in the GGI. As mentioned before, the GGI does not measure a level of an individual country, hence highly developed country like Japan or Korea can exhibit a relatively wide gender gap. Japan opens about $34 \%$ of overall gender gap and Korea does $35 \%$. Both countries show the widest gap in the political empowerment subindex.

[^1]About half of the APNN countries are positioned at lower than 100 in the GGI rankings, by closing roughly $65 \%$ of the overall gender gap except Pakistan where about $55 \%$ of the gap is closed. The GGI rankings and values of the APNN countries for last four years from 2014 to 2017 are given in Table 2-17. Australia's gender gap has been slightly widened, while New Zealand's gap has been slightly reduced. However, there has been no noticeable changes for last four years. Note that Taiwan's data were determined by the Taiwanese government based on the UNDP and WEF methodology.

### 2.4.5 Recent trends in Korea's GGI

Korea's global GGI scores in 2017 can be seen at glance in Figure 2-2. The shaded area indicates a connected Korea's scores of four subindices of the
<Figure 2-2 Korea's GGI at glance (2017)>

(source: WEF Global Gender Gap Report 2017, p.198)

GGI and the solid line guides the world average scores. Economy and politics dimensions show quite wide gender gaps to be closed. The gaps in economic participation and opportunity and political empowerment subindices are closed only $53.3 \%$ and $13.4 \%$ which are less than the world average $58.0 \%$ and $23.0 \%$, respectably. On the other hand, education attainment score is slightly less than the world average and health and survival score is about the average.

${ }^{\text {a }}$ Taiwan's data were determined by the Taiwanese government based on the UNDP and WEF methodology.
(source: http://eng.stat.gov.tw/ct.asp?xItem=25280\&ctNode=6032\&mp=5)
(Source: WEF Global Gender Gap Report 2006 ~ 2017)
Table 2-18 shows the evolution of Korea's GGI for last 12 years since 2006 when the WEF began reporting the GGI analysis. Political empowerment gap turns out to be most closed by $6.7 \%$ for last decade among subindices. The next performance is followed by economic participation and opportunity in which the gap is reduced by $5.2 \%$. Education and health dimensions that have already shown narrow gaps, close the gaps only by $1.2 \%$ and $0.6 \%$, respectively.

There are 14 indicators to measure four subindices. The rankings and scores of these 14 indicators for Korea are listed in Table 2-19 since 2011. Every indicators consisting of political empowerment subindex have been improved slowly but continuously to close the gaps. There has been almost no changes in health and survival since 2011. Female healthy life expectancy over male value has recorded a score of 1.06 and positioned at rank 1 , indicating that Korean women have relatively longer life expectancy than men. The gaps in education and economy subindices become wider since 2015. Literacy rate indicator is expected to affect the widening of the education gap. Female estimated earned income and wage equality indicators seem to affect the
widening of the gender gap in economic participation and opportunity, although female professional and technical workers over male value are noticeably increased from 0.69 in 2014 to 0.93 in 2017. The statistical figures as in Tables 2-18 and 2-19 indicate that changes do not occur in the short term. Hence to close the gender gaps in Korea is needed to design elaborate policies.

|  | Ratio: number of years of a female head of state (last 50 years) over male value (Rank) | $\begin{aligned} & 0.02 \\ & (40) \end{aligned}$ | $0.02$ <br> (41) | $\begin{aligned} & 0.03 \\ & (42) \end{aligned}$ | $\begin{aligned} & 0.05 \\ & (39) \end{aligned}$ | $\begin{aligned} & 0.07 \\ & (31) \end{aligned}$ | $\begin{aligned} & 0.09 \\ & (29) \end{aligned}$ | $\begin{aligned} & 0.10 \\ & (28) \end{aligned}$ |

2.4.6 Comparison of the GGI among ARN member countries

The 2017 GGI of 12 ARN member countries with rankings and scores for each dimension are listed in Table 2-20. Uganda performs best among the ARN by closing the overall gender gap up to $72 \%$ and by closing $31 \%$ of the political empowerment gap. Botswana fully closes the gender gap in education attainment subindex and does $82 \%$ of the gap in economic participation and opportunity subindex. Botswana shows progress on women in ministerial position, but only $7.9 \%$ is closed in the gap of political empowerment subindex. Kenya is positioned at the first rank in the health and survival subindex by closing $98 \%$ of the gap. Nigeria makes remarkable progress to close its gender gaps in women's estimated earned income, wage equality for similar work, enrolment in secondary education and healthy life expectancy, but a decline in women in ministerial positions and on the education attainment. As a result, Nigeria's overall gender gap becomes wider in 2017.

On average, the ARN member countries need to close the gaps 33\% overall, $32 \%$ in economy, $12 \%$ in education, $3 \%$ in health, and $83 \%$ in politics dimension. Compared to the APNN, the only gender gap in economic participation and opportunity subindex is more closed. However, it is again worth to point out that the GGI does not measure a level of an individual country.
<Table 2-20 GGI ranks and scores for ARN countries (2017)>

| GII <br> UN <br> Rank <br> /159 | GGI <br> ARN <br> Rank <br> /12 | Country | $\begin{gathered} \text { GGI } \\ (/ 144) \end{gathered}$ |  | Economic Participation and Opportunity |  | Education <br> Attainment |  | Health and Survival |  | Political Empowerment |  |

| 135 | 5 | Kenya | 76 | 0.694 | 44 | 0.720 | 120 | 0.929 | 1 | 0.980 | 83 | 0.147 |
| 150 | 8 | Liberia | 107 | 0.669 | 58 | 0.695 | 138 | 0.772 | 85 | 0.973 | 45 | 0.236 |
| 156 | 12 | Mali | 139 | 0.583 | 126 | 0.518 | 140 | 0.741 | 139 | 0.956 | 99 | 0.118 |
| - | 10 | Nigeria | 122 | 0.641 | 37 | 0.728 | 135 | 0.813 | 94 | 0.972 | 135 | 0.052 |
| 120 | 7 | Senegal | 91 | 0.684 | 102 | 0.624 | 132 | 0.831 | 87 | 0.973 | 29 | 0.308 |
| 129 | 3 | Tanzania | 68 | 0.700 | 69 | 0.674 | 125 | 0.910 | 62 | 0.976 | 44 | 0.239 |
| 121 | 1 | Uganda | 45 | 0.721 | 59 | 0.693 | 124 | 0.913 | 88 | 0.973 | 30 | 0.305 |
|  | ARN | Average |  | 0.673 |  | 0.678 |  | 0.875 |  | 0.971 |  | 0.166 |

(Source: WEF Global Gender Gap Report 2017)
Five out of the ARN member countries are positioned at lower than 100 in the GGI rankings, by closing roughly $63 \% \sim 67 \%$ of the overall gender gap except Mali where only $58 \%$ of the gap is closed. The GGI rankings and values of the ARN countries for last four years from 2014 to 2017 are given in Table 2-21. The overall GGI for last 4 years shows more or less increasing trends from $61 \%$ closed to $67 \%$ closed. Liberia and Uganda contribute most to close the overall gap of the ARN average. Uganda's GGI rank changes from 88 to 45
during last 4 years, which is the result of notable increases in women's share of estimated earned income and on the political empowerment. Burkina Faso, Senegal and Tanzania show slightly widening trends in the GGI.

The 2018 APNN \& ARN Survey Report

# 3. Survey on Gender Barrier among APNN and ARN Member Countries 

### 3.1. Background

The joint international survey has been conducted annually among members of the APNN (Asia and Pacific Nations Network) since 2014 with support from the Korean government. This study is in continuation of those conducted in 2014 on gender equality in science and engineering, in 2015 on glass ceiling experienced by woman scientists and engineers, in 2016 on gender barrier perceived by women scientists and engineers, and in 2017 on gender barrier experienced by women as perceived by men. This year's survey used the same format as that in 2016 with modifications in the questionnaire to suit the male respondents and the respondents that are still pursuing their studies in STEM. In addition, the African Network of INWES, ARN, has participated in this year's study. Because studies conducted from 2014 to 2017 included responses from a wide age group (20~over 50 years old), there was a slight tendency that could imply that gender barrier was becoming experienced less as the age group became younger. However, based on interviews and discussions with girls enrolled in science or engineering schools, the barrier seemed to have remained, if not becoming stronger. This is the reason why the 2018 survey focused on hearing the voices of 'future scientists and engineers.'

### 3.2. The Survey

### 3.2.1 Survey respondents, method and period

The 2018 survey was conducted in 12 member countries (Nepal, New Zealand, Malaysia, Mongolia, Bangladesh, Vietnam, Sri Lanka, India, Japan, Taiwan, Pakistan, and Korea) of the APNN and 3 member countries (Nigeria, Uganda, Kenya) of the ARN. Young female and male in science and engineering were asked about their perception of gender barriers. The respective networks that liaison the study were WISE-Nepal, IPENZ, IEM, WSTEM, WISE-Bangladesh, VAFIW, WISE-Sri Lanka, WISE-India, JNWES, TWiST, WISTEP, and KWSE from APNN and OPAGEST and AWSE from ARN. The original questionnaire was prepared in Korean and English while representatives of the member countries chose to translate the English version into their native language as needed.

The announcement for the 2018 survey was sent out to members of APNN May 27, 2018 via email. The questionnaires were prepared and sent out to members of APNN and ARN on June 15, 2018 together with the commencement of the online forms at https://goo.gl/forms/pnMbTD66VyNcs8fZ2. The survey was to be completed by end of July but because most of the respondents were at summer break, the collection was extended to September, 2018. The survey period, during which the instructional e-mail was sent, was from June 15 to July 31, 2018. Countries that participated in offline surveys compiled and
submitted their results by e-mail while the results of online surveys were downloaded via Google Forms.

### 3.2.2 Survey tool: Questionnaire composition

The survey consisted of 7 sections from $\mathrm{A} \sim \mathrm{G}$. The first section asked questions on general profiles of the respondents. Section B consisted of 6 questions of the perception of 'gender barriers' in STEM. Section C was to be answered only by the female respondents while D was for male respondents and both consisted of 6 questions on direct/indirect experience of gender barriers in STEM. Section E consisted of 3 questions on the perception on policy to overcome gender barriers. F with 5 questions was about Perception of Gender Role Stereotype and G consisted of 7 questions on the Perception of Gender Role Stereotype for study and research environment.

### 3.2.3 Analysis of survey data

Responses were coded excluding invalid or insufficient answers. For open-ended questions, similar or common answers were combined together and pre-coded. To ensure that the responses were properly coded, 20 questionnaires were randomly selected and checked. Any errors, if detected, were corrected. Next, SPSS Statistics version 20.0.01 was used to perform the following analyses.
(1) Basic analysis: Frequency and descriptive statistical analysis

Frequency and descriptive statistical analysis were performed for all questions in the questionnaire.
(2) Differential and correlational analysis

An independent t-test and two-way ANOVA were employed to analyze the general characteristics of respondents and differences in perceptions of the gender barriers. The analyses were performed on the individual items as well as sub-scales such as the perception of discriminatory reality, discriminatory experiences and gender role ideology. Welchi test was performed to allow multiple comparisons between groups if required.

Pearson's correlation was used to examine the relationships between continuous variables, including the perception of discriminatory reality, discriminatory experiences, gender role ideology, career prospects and policy demands.

### 3.2.4 The Questionnaire

The following is the questionnaire form that was sent to the APNN and ARN representatives [Table 3-1].
<Table 3-1 The Questionnaire Form >

## Gender Barriers in STEM* in Africa, Asia and the Pacific : The 2018 survey for Science and Engineering Young \& Future Professionals in Africa, Asia and the Pacific Nations (APNN \& ARN)_For respondents of age 19~30.

The purpose of this survey is to evaluate how the young and future scientists and engineers perceive "gender barriers" experienced by women in STEM. The term "gender barriers" is used in this study to describe hurdles and obstacles women in STEM experience in their educational and professional lives because of their biological and social identity as women.

Please take time to answer each and every question as truthfully as possible. There are no right or wrong answers. Please respond based on your experiences and thoughts. Your response and those of approximately 1,200 other young and future scientists and engineers from over 13 countries in Africa and Asia and the Pacific will be utilized in drawing out policy agenda to expand women's participation as well as to promote regional and national development in STEM. Please be assured thant your answers will be used only for analytical purpose. Your personal information will be kept in strict confidence. We deeply appreciate your cooperation.

Please note that this survey is only for respondents (both male and female) who are in the fields of natural science or engineering, born between 1988 to 1998, being of $19 \sim 30$ years of age. Please do not participate if you were born before 1988 or after 1998 or if you are not in the STEM field. For female respondents, please answer A, B, C, E, F, G; for male respondents, please answer A, B, D, E, F, G. Thank you.
*STEM : Science, Technology, Engineering, Mathematics

## A. Personal Information

1. Sociodemographic information
(1) Your sex (1) female (2) male (3) other
(2) Year of birth $\qquad$ (please respond if you were born $\mathbf{1 9 8 8} \sim 1998$ )
2. Major and degree
(1) Please select your major field
(1) Nature Science (2) Engineering (Technology)
(2) Your specific Major in STEM. $\qquad$ (eg. Physics, Chemical Engineering, etc.)
(3) Your current status
(1) Undergraduate Student pursuing bachelors degree
(2) Graduate Student pursuing Masters degree
(3) Working, with Masters degree
(4) Graduate Student, Candidate of Doctorate degree
(5) Working, with Doctorate degree
(6) Postdoctoral Fellow (postdoc)
(7) Others
3. Your Nationality
(1) Your nationality. $\qquad$ (eg. India)
(2) Country where you are currently enrolled or employed (eg: South Korea)

## B. Perception of 'gender barriers' in STEM

* Please indicate ' O ' or ' $\sqrt{ }$ ' in the box below that corresponds to your answer.
(1) Girls and boys are equally encouraged to choose their
majors in STEM during their education period.
C. Direct/Indirect Experience of 'gender barriers' in STEM: Questions only for Women
* If you are female, please indicate ' $O$ ' or ' $\sqrt{ }$ ' in the box that corresponds to your (indirect) experiences.

|  | (1) <br> Never experienced, seen nor heard from others | (2) <br> Neither seen nor heard but recognize the possibility | (3) Heard from others | (4) <br> I have seen others experience | (5) <br> Experienced for myself |
| :---: | :---: | :---: | :---: | :---: | :---: |
| (1) Women in STEM being disadvantaged in receiving grade appraisal, research funds or scholarships because she is female |  |  |  |  |  |
| (2) Women in STEM being disadvantaged in participating or leading a research project because she is female. |  |  |  |  |  |
| (3) Women in STEM being sexually harassed (linguistical or physical) or treated unfairly by their colleagues(in class, laboratory, project group, etc) |  |  |  |  |  |
| (4) Women in STEM being sexually harassed (linguistical or physical) or treated unfairly by their senior classmate, lab-mate or professor (in university laboratory or project group, etc) |  |  |  |  |  |
| (5) Women in STEM being disadvantaged in accessing research equipment or information because she is female |  |  |  |  |  |
| (6) Women in STEM being in trouble or leaving work due to her marriage, pregnancy or child care |  |  |  |  |  |

## D. (Indirect) Experience of 'gender barriers' in STEM: Questions only for Men

* If you are male, please indicate ' O ' or ' $\sqrt{ }$ ' in the box that corresponds to your (indirect) experiences.

|  | (1) <br> Never seen nor heard from others | (2) <br> Neither seen nor hear but recognize the possibility | (3) <br> Heard from others about unknown person's case | (4) <br> Heard from my colleague or known person's experience | (5) <br> I have <br> seen someone <br> experience |
| :---: | :---: | :---: | :---: | :---: | :---: |
| (1) Women in STEM being disadvantaged in receiving grade appraisal, research funds or scholarships because she is female |  |  |  |  |  |
| (2) Women in STEM being disadvantaged in participating or leading a research project because she is female. |  |  |  |  |  |
| (3) Women in STEM being sexually harassed (linguistical or physical) or treated unfairly by their colleagues(in class, laboratory, project group, etc) |  |  |  |  |  |
| (4) Women in STEM being sexually harassed (linguistical or physical) or treated unfairly by their senior classmate or labmate or professor (in university laboratory, project group, etc) |  |  |  |  |  |
| (5) Women in STEM being disadvantaged in accessing to research equipment or information because she is female |  |  |  |  |  |
| (6) Women in STEM being in trouble or leaving work due to her marriage, pregnancy or child care |  |  |  |  |  |

E. Perception on policy to overcome 'gender barriers'

* Please indicate ' $O$ ' or ' $\sqrt{ }$ ' in the box below that corresponds to your response.
(1) I believe things will turn out fine in the future career for

women in STEM (2) | It is crucial to have strong policy support to solve gender |
| :--- |
| inequality in the STEM field. |

## F. Perception of gender equality

* Please indicate ' O ' or ' $\sqrt{ }$ ' in the box below that corresponds to your response.

| (1)In a relative sense, men are rational while women are <br> emotional and thus, they ought to complement each other by <br> doing what is appropriate for themselves |
| :--- |
| (2) Primary breadwinners (who take care of financial obligations) |
| of households should be men |

(3) Women are born to have a way of caring children that men
are not capable of in the same way
G. Perception of gender equality for study and research environment

* Now these are our final question. Please indicate ' O ' or ' $\sqrt{ }$ ' in the box below that corresponds to your response.
(1) Women are equally granted or entrusted equal role for their
research or project performance at the laboratory.
(2) Women equally receive the appraisal or award for the outcome

of their project or research. (3) The strictness, objectiveness and importance of the research | outcome are equally respected regardless of the sex of the |
| :--- |
| person in charge. |
| (4) Dealing with the funding donors (those providing funding for |
| the project) in terms of administrative or budget process of |
| the research project is equally fair regardless of the sex of |
| applicant. |

We have come to the end of the survey. Thank your for your time and participation!! $\Omega$

## 4. Results of the Survey on Gender Barrier

The current study has collected 2,094 valid responses from 15 countries, of which 12 were APNN countries and 3 were ARN countries. There were 1,604 responses from APNN member countries (76.6\%) and 490 responses from ARN (23.4\%) member countries. Respondents consisted of 1,011 female (48.3\%) and 1,083 male $(51.7 \%)$ young adults in science and engineering. Among the 2,094 respondents, $1,277(61.0 \%)$ were in the field of engineering, and 817 (39.0\%) in natural sciences. 943 (45.0\%) respondents were undergraduate students, While the other 737 ( $35.2 \%$ ) were studying or working after completing their bachelors degree in science or engineering field. The average age of the respondents was 24.18 (excluding those who did not indicate their age).

This chapter provides the survey results from respondents of APNN and ARN member countries. We first outlined the general profile of respondents (sex, age, major field of study and current status/degree). Then we summarized the results according to the 5 sub-areas of the questionnaire.

### 4.1. General Respondent Profiles

### 4.1.1 General Respondent Profiles of APNN member countries

Among the 13 APNN member countries, 1,604 valid responses were collected from 12 countries as shown in Table 4-1 The number of respondents varied depending on the countries, ranging from 227 from Vietnam to 16 from India. The profile of respondents' age, sex, major field, degree and nationality are provided below [Table 4-1].

## - Female / Male

There were 812 female (50.6\%) and 792 male (49.4\%) young adults in S\&T who responded to the survey. The female/male ratio varied among countries. More than $50 \%$ of the total respondents were female from Sri Lanka (76.1\%), Japan (62.8\%), Mongol (54.1\%) and Pakistan (50.3\%), while more than $50 \%$ of the total respondents were male from Malaysia (62.5\%), New Zealand (55.8\%), South Korea (54.8\%), Bangladesh (54.2\%), Vietnam (52.0\%) and Taiwan ( $51.1 \%$ ). The sex ratio of participants was balanced at $50 \%$ from Nepal.

## - Nationality (where enrolled and employed)

Out of 1,604 respondents from APNN, the highest number of participants came from Vietnam at 227 (14.2\%), followed by South Korea at 219 ( $13.7 \%$ ), Mongolia at 209 (13.0\%), Pakistan at 199 (12.4\%), Taiwan at 186 (11.6\%), Japan at 180 (11.2\%), Nepal at 96 (6.0\%), New Zealand at 95 (5.9\%) and Sri Lanka at $46(2.9 \%)$. The number or respondents from Malaysia and India were $24(1.5 \%)$ and $16(1.0 \%)$ respectively. The survey report by countries (see Appendix) for Malaysia and for India thus could not be prepared due to the insufficient number of respondents.

- Age

The average age of the 1,604 APNN respondents' was 24.18. Male respondent (24.24) were slightly older than female (24.12) on the average.

- Major field of study

Regarding the major field of respondents, engineering accounted for 1,019 ( $63.5 \%$ ), and natural sciences 585 (36.5\%). Among female respondents of APNN member countries, 491 persons ( $60.5 \%$ ) were studying, or doing research or working in engineering while 321 (39.5\%) were in natural sciences. For male respondents, 528 ( $66.7 \%$ ) were in engineering and 264 (33.3\%) in natural sciences.

## - Current Status (Degree)

Out of the 1,604 respondents of APNN member countries, 647 (40.3\%) were undergraduate students, $415(25.9 \%)$ were graduate students in masters degree programs and 126 (7.9\%) were graduate students pursuing their doctorate degree. The respondents working with masters degree were 222 (13.8\%) and those working with doctorate degree $24(1.5 \%)$. The respondents who checked theirs status as others were 170 persons ( $10.6 \%)^{1}$ ).
<Table 4-1 Profile of Respondents by Country from APNN>

| APNN |  | Female |  | Male |  | Total |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  | person | \% | person | \% | person | \% |
|  |  | 812 | 100.0 | 792 | 100.0 | 1,604 | 100.0 |
| Country <br> where <br> working <br> or <br> enrolled | Nepal | 48 | 5.9 | 48 | 6.1 | 96 | 6.0 |
|  | New Zealand | 42 | 5.2 | 53 | 6.7 | 95 | 5.9 |
|  | Taiwan | 91 | 11.2 | 95 | 12.0 | 186 | 11.6 |
|  | Malaysia | 9 | 1.1 | 15 | 1.9 | 24 | 1.5 |
|  | Mongolia | 113 | 13.9 | 96 | 12.1 | 209 | 13.0 |
|  | Bangladesh | 49 | 6.0 | 58 | 7.3 | 107 | 6.7 |
|  | Vietnam | 109 | 13.4 | 118 | 14.9 | 227 | 14.2 |
|  | Sri Lanka | 35 | 4.3 | 11 | 1.4 | 46 | 2.9 |
|  | India | 4 | 0.5 | 12 | 1.5 | 16 | 1.0 |
|  | Japan | 113 | 13.9 | 67 | 8.5 | 180 | 11.2 |
|  | Pakistan | 100 | 12.3 | 99 | 12.5 | 199 | 12.4 |

### 4.1.2 General Respondent Profiles of ARN member countries

This is the first study in which ARN member countries were included; the APNN countries have participated since 2014. Nigeria, Uganda and Kenya participated from which a total of 490 valid responses were collected. The profiles of the respondents are provided in [Table 4-2].

## - Female / Male

Among those responded, 199 (40.6\%) were female, and 291 (59.4\%) were male young adults in S\&T. More than $60.0 \%$ of the respondents was male in Nigeria (61.4\%) and Uganda (67.1\%). Among the 66 respondents from Kenya, 26 were male (39.4\%).

- Nationality (where enrolled and/or employed)

Out of the 490 respondents from the 3 ARN member countries this year, the highest number of participants came from Nigeria at 345 ( $70.4 \%$ ), followed by Uganda at 79 (16.1\%), and Kenya at 66 (13.5\%).

## - Age

The average age of the 490 ARN respondents was 24.581). Male respondent (24.94) were slightly older than female (24.16) on average. Participants from Uganda were the oldest on the average (24.96), and those from Nigeria were the youngest (23.00).

## - Major field of study

Regarding the major field of respondents, engineering accounted for 258 (52.7\%), and natural sciences 232 ( $47.3 \%$ ). Among the 199 female respondents of the 3 ARN member countries, 112 persons ( $56.3 \%$ ) were studying, doing research or working in natural sciences while 87 (43.7\%) were in engineering. For male respondents, 171 (58.8\%) were in engineering and 120 (41.2\%) in natural sciences.

## - Current Status (Degree)

Out of the 490 respondents of ARN member countries, 296 (60.4\%) were undergraduate students, $74(15.1 \%)$ were graduate students in master degree programs, 45 ( $9.2 \%$ ) were working after their doctorate degree, 32 ( $6.5 \%$ ) were graduate students in doctoral program and 26 (5.3\%) were working after their master degree. The respondents who checked theirs status as others were 17 persons (3.5\%) ${ }^{2}$ ).

Overall, respondents from APNN countries consisted of $50.6 \%$ female and $49.4 \%$ male.

The average age of respondents was 24.18. Respondents from New Zealand were the youngest (22.03), followed by Taiwan (22.91), Pakistan (23.18), and South Korea (24.11). Respondents from Sri Lanka were the oldest (25.66), followed by Mongolia (25.36), Nepal (25.21), Vietnam (25.15), Bangladesh (24.30) and Japan (24.34).

The ratio between engineering majors and natural science majors was $63.5 \%$ to $36.5 \%$. The country with the most number of respondents from engineering were New Zealand (100\%), Nepal (99\%), Pakistan (98.5\%), South Korea ( $80.8 \%$ ) and Mongolia ( $67.5 \%$ ). On the other hand, those with higher number of respondents from natural sciences were Taiwan (80.6\%), Sri Lanka (69.6\%), Bangladesh (67.3\%), Japan (56.1\%) and Vietnam (50.2\%).

Majority of those responded were graduate students and/or working with their masters/doctoral degree ( $49.1 \%$ ) while $40.3 \%$ were undergraduate students. $10.6 \%$ checked 'others' as theirs status (degree). Among the APNN countries, Vietnam had the most number of graduate students and/or working with masters/doctoral degree ( $81.1 \%$ ) followed by Japan (62.2\%), Nepal (58.3\%) and Sri Lanka ( $54.3 \%$ ). Undergraduate students were more higher in number from New Zealand (84.2\%), Taiwan (60.8\%) and South Korea (48.4\%).

Figure 4-1 shows the female respondents make up according to country and Figure 4-2 shows that of male respondents. Among the total number of female respondents in APNN, Mongolia and Japan showed the highest numbers, consisting of $13.92 \%$ and India the lowest of $0.49 \%$. Among male respondents, Korean respondents were highest at $15.2 \%$ and Sri Lanka lowest at $1.4 \%$.

<Figure 4-1 Female respondents make up by country in APNN>

<Figure 4-2 Male respondents make up by country in APNN>

### 4.1.5 General Profiles of Respondent by Country (ARN)

The following table shows the general profiles of the respondents from ARN countries.
<Table. 4-5 Respondent Profile by Country from ARN>

| Country | Sex (\%) | Average Age | Major Field (\%) |  |  | Current Status (Degree) (\%) |  |  | Nationality (\%) |  |  |

Table 4-5 compares the respondent profiles by country in ARN. Overall, respondents from ARN countries consisted of $40.6 \%$ female and $59.4 \%$ male.

There were more female respondents than male in Kenya (60.6\%) while more male respondents from Uganda (67.1\%) and Nigeria (61.4\%).

The average age of respondents was 24.58. Respondents from Nigeria were the youngest (23.00), followed by Kenya (24.20) and Uganda (24.96). However, only $30.8 \%$ indicated their age, and thus the average does not include $69.8 \%$ of respondents.

Over half of the respondents were in engineering (52.7\%) while 47.3\% were in natural sciences. The overall ratio was not as high as that of APNN due to the high percentage of respondents in natural sciences from Uganda (73.4\%). Nigeria and Kenya consisted of less than half of respondents in natural sciences ( $41.2 \%$ and $48.5 \%$ respectively).

A higher ratio of undergraduate students (60.4\%) are shown in ARN. Graduate students and/or working with their master/doctoral degree were $36.1 \%$ while $3.5 \%$ responded as 'others.' Undergraduates among female respondents were highest from Nigeria (87.7\%) followed by Uganda (65.4\%) and Kenya ( $57.5 \%$ ). On the other hand, undergraduates were highest among male students in the order of Kenya (84.6\%), Uganda (52.8\%) and Nigeria (42.5\%).

Figure 4-3 shows the female respondents make up according to country and Figure 4-4 shows that of male respondents. Among the total number of female respondents in ARN, Nigerian respondents were the majority followed by those from Kenya and Uganda. Among male respondents, Nigerian were the majority followed by those from Uganda and Kenya.

### 4.2. Results from APNN

### 4.2.1. Overall Results of APNN by Sub-area and by Country <br> The following is a cross-country comparison of the results by sub-area from APNN (see Table 4-6 and Table 4-7)

<Table 4-6 Summary of Results by sub-areas and by Country from APNN>

${ }^{\text {a) }}$ Perception of Gender Barriers in STEM
${ }^{\text {b) }}$ Direct/Indirect Experience of Gender Barriers in STEM
c) Women Career Outlook in STEM
${ }^{\text {d) }}$ Need for Support policy to overcome gender barrier in STEM
e) Perception of Gender Equity
${ }^{\text {f }}$ Perception of Gender Stereotype
${ }^{\text {g) }}$ Perception of Gender Barriers for the study and research environment in STEM
${ }^{\text {h) }}$ Excluding data from Malaysia and India. In other tables APNN average includes both Malaysia and India.
$\left.{ }^{i}\right)$, j) Welchi test, as robust ANOVA was applied to analyze the differences between countries, according to variable sample sizes by country.

<Figure 4-5 Summary of Results by sub-areas from APNN>
Blue bars indicate APNN average of female respondents and red bars indicate APNN average of male respondents.

The average APNN values in Table 4-6 do not include results from Malaysia and India and thus may slightly differ from values in other tables.
<Table 4-7 Summary of scores of individual questions of APNN>

| Sub-area |  | Question | sex | average | standard deviation | t | (p) |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 1. <br> Perception of Gender Barriers (P.G.B) | 1 | Girls and boys are equally encouraged to choose their majors in STEM during their education period. | female male | $\begin{aligned} & \hline 2.46 \\ & 2.29 \\ & \hline \end{aligned}$ | $\begin{aligned} & 1.252 \\ & 1.153 \\ & \hline \end{aligned}$ | 2.802 | $0.005^{* *}$ |
|  | 2 | Female students in STEM receive equally fair assessments and appraisal compared to their male counterparts of the same qualifications and level for their work, task or project results. | female <br> male | 2.51 2.29 | $\begin{aligned} & 1.191 \\ & 1.166 \end{aligned}$ | 3.724 | $0.000^{* *}$ |
|  | 3 | Women in STEM receive equal work distribution and work appraisal compared to men of the same qualifications and level. | female male | 2.88 2.50 | $\begin{aligned} & 1.235 \\ & 1.207 \end{aligned}$ | 6.235 | $0.000^{* * *}$ |
|  | 4 | It is equally difficult for a woman to get a job in the STEM field than for a man with the same qualifications. | female male | $\begin{aligned} & 2.74 \\ & 2.82 \end{aligned}$ | $\begin{aligned} & 1.200 \\ & 1.193 \end{aligned}$ | -1.299 | 0.194 |
|  | 5 | Being promoted or becoming a tenured professor or a principal investigator is equally difficult for female scientists than for male. | female male | $\begin{aligned} & 2.76 \\ & 2.82 \end{aligned}$ | $\begin{aligned} & 1.141 \\ & 1.194 \end{aligned}$ | -0.938 | 0.349 |
|  | 6 | Women in STEM generally receive equal pay for equal work, compared with their equally-qualified male colleagues. | female male | $\begin{aligned} & 2.87 \\ & 2.57 \end{aligned}$ | $\begin{aligned} & 1.140 \\ & 1.178 \end{aligned}$ | 5.083 | $0.000^{* * *}$ |

## - Perception of Gender Barriers in STEM

: Higher score, higher Perception of Gender Barriers (5-point scale).
As shown in Table 4-7, the average scores on the Perception of Gender Barriers ( 2.70 for female respondent, 2.56 for male) indicates that respondents overall do not feel that severe discrimination existed. However, a statistically significant difference $(\mathrm{t}=3.814, \mathrm{p} \leq 0.000)$ between female and male respondents was observed on average; the score for female was generally higher than that of male from the sum of 6 questions. Female participants responded with the highest score of 2.88 for the statement, "Women in STEM receive equal work distribution and work appraisal compared to men of the same qualifications and level" followed by 2.87 for "Women in STEM generally receive equal pay for equal work, compared with their equally-qualified male colleagues." However, two questions showed higher scores from male respondents, although not statistically significant. It is noteworthy that men perceived more discrimination of women than women themselves on the two statements "It is equally difficult for a woman to get $a$ job in the STEM field than for a man with the same qualifications" and "Being promoted or becoming a tenured professor or a principal investigator is equally difficult for female scientists than for male."

## - Experience of Gender Barriers

: Higher score, more Experience of Gender Barriers (5-point scale).
The average score on Experience of Gender Barriers (2.35 for female and 2.20 for male, Table 4-7) indicates that respondents perceive experiences of gender barriers as "neither seen nor heard but recognize the possibility." A statistically significant difference according to $t$-test was observed between results from female and male respondents $(\mathrm{t}=3.944, \mathrm{p} \leq 0.000)$. On average of the six questions, the scores from female participants were higher than those from male. Both female (2.81) and male (2.51) gave the highest score for experience of "Women in STEM being in trouble or leaving work due to her marriage, pregnancy or child care have the same effect on scientists/engineers regardless of their sex for their study, research or project performance, pregnancy or child care", followed by 2.50 (female) and 2.32 (male) on "Women in STEM being sexually harassed (linguistical or physical) or treated unfairly by their colleagues (in class, laboratory, project group, etc)." The question with the lowest score from male respondents among the 6 questions was 1.90 for "Women in STEM being disadvantaged in accessing research equipment or information because she is female", followed by 1.91 for "Women in STEM being disadvantaged in receiving grade appraisal, research funds or scholarships because they are female". For female respondents, the lowest scored question was 2.08 for "Women in STEM being disadvantaged in receiving grade appraisal, research funds or scholarships because she is female" followed by 2.17 for "Women in STEM being disadvantaged in accessing research equipment or information because they are female." The results show that more severe experience of gender barriers are on sexual or biological aspects of women compared to those related to research or work.

## - Career Outlook for Women in STEM

: Higher score means more positive outlook (5-point scale).
As shown in Table 4-7, how career outlook is perceived by young female adults was examined through the statement "I believe things will turn out fine in the future career for women in STEM." The responses were reverse coded such that a higher score indicates a more positive outlook. The average response at 3.82 from female respondents showed that they were optimistic. Interestingly, an even higher score of positive outlook at 4.03 was observed from male respondents.

## - Need for Policy to Overcome Gender Barriers

: Higher score means more agreement to supportive policy (5-point scale).
Two questions were asked for this sub-area as shown in Table 4-7. However, unlike the other sub-areas, the two questions are dealt separately rather than by average. The sub-area 'NSP' herein comprehensively showed is the response result for the first question in the sub-area. The responses to "It is crucial to have strong policy support to solve gender inequality in the STEM field" were reversely coded, and the results showed an average of 3.99 for female respondents and 3.78 for male respondents. Even though the average score is significantly different ( $\mathrm{t}=3.785, \mathrm{p} \leq 0.000$ ) between female and male respondents, that is female respondents seemed to agree more than male respondents, both scores reflect a high demand for supportive policy.
The scores for introducing a quota system or affirmative action plan (question 4-2) were 3.70 for female respondents and 3.25 for male respondents with a statistical significant difference between the sexes $(\mathrm{t}=7.862, \mathrm{p} \leq 0.000)$. It is noteworthy that both female and male young scientists and engineers responded with a strong need for policy to overcome gender barriers yet the responses to the introduction of a quota system were not as strong, especially from men.

## - Perception of Gender Role Stereotype

: Higher score means more progressive gender role perception
To measure the respondents' attitudes towards gender role stereotype within their family or social environment, four questions were asked as shown in Table 4-7. The average response to the four questions was 3.47 for female and 3.18 for male respondents. The most progressive attitude was found in "In order to maintain the order and peace of a family, the husband should have a greater power and authority than the wife" with an average of 3.73 (female) and 3.45 (male). This shows that most respondents did not agree on patriarchal power within the family. The second most progressive attitude was shown in the scores of 3.39 by female respondents on "Women are born to have a way of caring children that men are not capable of in the same way" and 3.25 by male respondents on "Primary breadwinners(who take care of financial obligations) of households should be men." For the statement "In a relative sense, men are rational while women are emotional and thus, they ought to complement each other by doing what is appropriate for themselves" received the lowest score at 3.07 from female respondents and at 2.81 from male respondents.

## - Perception of Gender Equity

## : Higher score means higher gender equity perception

This sub-area consisted of one question asking whether equal opportunities can be a sufficient condition for achieving gender equality. The question was to examine the understanding of the gender equality concept ${ }^{1)}$. We interestingly find that the average score from male respondents on this statement is significantly higher than that from female respondents $(\mathrm{t}=-2.706, \mathrm{p} \leq 0.007)$ although both male (2.42) and female (2.24) average scores were less than the middle value of 3.0 (Table 4-7). In other words, both male and female respondents seemed to have weak understanding of gender equity.

## - Perception of Gender Barrier for study and research Environment

: Higher score means higher perception of gender equality for study and research environment in STEM

This sub-area has been newly added this year because the respondents were those in their twenties and mostly expected to be in school or research labs. The 7 questions in this sub-area aimed to capture overt / covert discriminatory reality that may exist in educational or research environment for female students or young adults ${ }^{2}$ ). The average score for the seven questions was 2.58 for female and 2.28 for male (Table 4-7). The strongest perception from respondents was shown in "Marriage, pregnancy or child care have the same effect on scientists/engineers regardless of their sex for their study, research or project performance," with scores of 3.10 (female) and 2.59 (male), followed by "Women receive the same social evaluation and respect to men as scientists or engineers (by their colleagues, professor, funding donors, academic association, scientific society etc)," showing an average of 2.68 by female respondents and 2.22 by male respondents. We reversely coded the response score of the question "Female students in STEM are intimidated in the laboratory or in classes because they are female" The average score for this question was 2.75 by female and 2.79 by male respondents. The statement "Women equally receive the appraisal or award for the outcome of their project or research" got the lowest score of 2.01 from male respondents, while "The strictness, objectiveness and importance of the research outcome are equally respected regardless of the sex of the person in charge" of 2.26 from female respondents. Sex difference on the

[^6]7 questions was statistically significant $(\mathrm{t}=7.970, \mathrm{p} \leq 0.000)$.

### 4.2.2 Analyses of Variables by sub-areas (APNN)

## 1) Perception of Gender Barriers

Table 4-8 lists the average scores of 6 questions for sub-area 1 according to their major field and current status for both sexes. The results of 2 way Analyses of Variances (ANOVA) is shown in Table 4-9. There existed significant differences independently by major field ( $\mathrm{F}=8.37$, $\mathrm{df}=1,790, \mathrm{p} \leq 0.004$ ) and by current status ( $\mathrm{F}=3.62, \mathrm{df}=5,790, \mathrm{p} \leq 0.003$ ) for female respondents. For male respondents there was a significant interaction effects between the major field and current status of respondents $(\mathrm{F}=2.67, \mathrm{df}=5,768, \mathrm{p} \leq 0.021)$.

For female respondents, a significant difference in the Perception of Gender Barriers was observed between those in engineering and natural sciences, engineering showing higher values of 2.86 compared to those in natural sciences of 2.46. Difference was also observed among those of different status, that is whether one is a student pursuing a masters degree or studying for a doctoral degree. Female respondents working with a masters degree showed highest score of 2.93.

For male respondents, those in engineering (2.63) also showed higher values than those in natural sciences (2.38) and those working with a Ph.D (2.82) showed the highest value compared to others. In addition, difference among those in different majors and current status was observed. That is, male undergraduate student in natural science (2.16) would show a difference in perception of gender barrier from respondents working with MA in engineering (2.50). Those with the highest score among male respondents was those working with their Ph.D (2.95) in engineering.

Cross country comparison of PGB is shown in Figure 4-6 below. Both female and male responses was lowest from Taiwan (2.16, 1.93) and highest from Pakistan (3.21, 3.09). In general, all APNN countries showed higher scores from female respondents compared to their male counterparts.
<Table 4-8 Comparison of scores from Sub-area 1 by Personal Variable from APNN>

<Table 4-9 Analyses of Variables for Sub-area 1 (PGB, APNN)>

| 1 | Female |  |  |  | Male |  |  |  |

<Figure 4-6 Comparative PGB values by APNN Countries (female and male)> Blue bars (above) represent data for female, red bars (below) represent data for male.

## 2) Experience of Gender Barriers (EGB)

There were 6 questions to measure the direct and/or indirect Experience of Gender Barriers. For this sub-area, women and men were asked different questions: women were asked of their direct experience while men were asked if they have seen/heard of women's experience. The comprehensive result for these 6 questions was categorized as 'Experience of Gender Barriers' (EGB) and Table 4-10 lists the average scores of 6 questions for sub-area 2 according to their major field and current status. The overall average was 2.35 for female and 2.20 for male. The higher score means the more direct (female) or indirect (male) Experience of Gender Barriers.
<Table 4-10 Comparison of scores from Sub-area 2 by Personal Variable from APNN>

| Major Field |  | Female |  |  | Male |  |  |

| 2 | Female |  |  |  | Male |  |  |  |
| :---: | ---: | ---: | ---: | ---: | ---: | ---: | ---: | :---: |
|  | df | F | p | $\mathrm{eta}^{2}$ | df | F | p | $\mathrm{eta}^{2}$ |
| Total | 12 | 571.12 | 0.000 | 0.897 | 12 | 416.42 | 0.000 | 0.877 |
| MAJORFIELD | 1 | 0.28 | 0.598 | 0.000 | 1 | 0.51 | 0.475 | 0.001 |
| CURRENTSTATUS | 5 | 3.11 | 0.009 | 0.019 | 5 | 8.41 | 0.000 | 0.057 |
| MAJORFIELD * CURRENTSTATUS | 5 | 2.85 | 0.015 | 0.018 | 5 | 1.10 | 0.359 | 0.008 |
| error | 790 |  |  |  | 699 |  |  |  |

The scores by female respondents were higher than those of male respondents. The results of 2 way Analyses of Variances (ANOVA) are shown in Table 4-11. For female respondents a significant interaction effect between major field and current status of respondents ( $\mathrm{F}=2.85$, $\mathrm{df}=5,790, \mathrm{p} \leq 0.015$ ) was observed. Graduate students in doctoral studies (2.16) showed the lowest EGB among female respondents in natural sciences while those working with Ph.D
(1.89) showed the lowest EGB among engineering female respondents. For male, there existed significant differences independently by current status ( $\mathrm{F}=8.41, \mathrm{df}=5$, 699, $\mathrm{p} \leq 0.000$ ). Undergraduate students (1.97) showed the lowest indirect EGB while those working with MA degree or students in doctoral studies showed more indirect EGB among the male respondents.

Figure 4-7 is the cross country comparison of EGB in APNN countries. For both female and male respondents, Japan showed the lowest score of 1.75 and 1.54 respectively while Sri Lanka the highest scores of 2.76 and 3.68 respectively. Except for Vietnam, Sri Lanka and Taiwan, scores for EGB were higher for female respondents than male.

<Figure 4-7 Comparative EGB values by APNN Countries (Female and Male)> Blue bars (above) represent data for female, red bars (below) represent data for male.

## 3) Career Outlook (CO)

Table 4-12 lists the average scores for sub-area 3. The overall average was 3.82 for female and 4.03 male respondents. The higher score means more positive prospect on career outlook for women in STEM.
<Table 4-12 Comparison of scores from sub-area 3 by Personal Variable from APNN>

| Major Field |  | Female |  |  | Male |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  | N | Average | standard deviation | N | Average | standard deviation |
| NATURAL SCIENCE | UNDERGRADUATE STUDENT | 131 | 3.67 | 0.980 | 103 | 4.18 | 0.988 |

|  | TOTAL | 802 | 3.82 | 1.011 | 789 | 4.03 | 0.944 |

<Table 4-13 Analyses of Variables for Sub-area 3 (CO, APNN)>

| 3 | Female |  |  |  | Male |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | df | F | p | $\mathrm{eta}^{2}$ | df | F | p | eta $^{2}$ |
| Total | 12 | 987.00 | 0.000 | 0.937 | 12 | 1265.59 | 0.000 | 0.951 |
| MAJORFIELD | 1 | 3.08 | 0.080 | 0.004 | 1 | 4.26 | 0.039 | 0.005 |
| CURRENTSTATUS | 5 | 4.01 | 0.001 | 0.025 | 5 | 2.28 | 0.045 | 0.014 |
| MAJORFIELD * CURRENTSTATUS | 5 | 2.36 | 0.039 | 0.015 | 5 | 5.08 | 0.000 | 0.032 |
| error | 790 |  |  |  | 777 |  |  |  |

A significant effect from current status $(\mathrm{F}=4.01$, $\mathrm{df}=5,790, \mathrm{p} \leq$ 0.001) was observed for female respondents while that from major field ( $\mathrm{F}=$ 4.26 , $\mathrm{df}=1,777, \mathrm{p} \leq 0.039$ ) was observed for male respondents. The 2 way ANOVA result show a significant interaction effects between major field and current status for both women $(\mathrm{F}=2.36, \mathrm{df}=5,790, \mathrm{p} \leq 0.039)$ and men $(\mathrm{F}=5.08$, $\mathrm{df}=5,777, \mathrm{p} \leq 0.000$ ).

For male respondents in natural science, the score of undergraduate students (4.18) was the highest, while the score of working with MA (3.50) was the lowest. On the other hand, for male respondents in engineering the highest score was of the graduate students in doctoral degree (4.35), followed by
graduate students in masters degree (4.26). The score of male respondents working with Ph.D (3.43) was the lowest in engineering.

Figure 4-8 is the cross country comparison of CO in APNN countries. The average score of Vietnam (3.23) was the lowest while Mongolia (4.33) was the highest for female respondents. For male, the score from Vietnam (3.51) was the lowest while that of Nepal (4.85) was the highest.

<Figure 4-8 Comparative CO values by APNN Countries (Female and Male)> Blue bars (above) represent data for female, red bars (below) represent data for male.

## 4) Need for Supportive Policy (NSP)

Table 4-14 lists the average scores for the first question of sub-area 4. The results are reversely coded to show that higher score means higher agreement to the need for supportive policy. The overall average was 3.99 female and 3.78 male.
<Table 4-14 Comparison of scores from sub-area 4 by Personal Variable from APNN>

| MAJORFIELD | 1 | 15.89 | 0.000 | 0.020 | 1 | 0.75 | 0.388 | 0.001 |
| CURRENTSTATUS | 5 | 2.18 | 0.054 | 0.014 | 5 | 4.27 | 0.001 | 0.027 |
| MAJORFIELD * CURRENTSTATUS | 5 | 9.43 | 0.000 | 0.056 | 5 | 4.56 | 0.000 | 0.029 |
| error | 788 |  |  |  | 775 |  |  |  |

In general, the score by female respondents was higher than that of male respondents. The 2 way ANOVA results show that a significant effect from major field ( $\mathrm{F}=15.89, \mathrm{df}=1,788, \mathrm{p} \leq 0.000$ ) was observed in female while from current status ( $\mathrm{F}=4.27 \mathrm{df}=5,775, \mathrm{p} \leq 0.001$ ) was observed for male. A significant interaction effect existed between major field and current status for both female ( $\mathrm{F}=9.43 \mathrm{df}=5,788, \mathrm{p} \leq 0.000$ ) and male ( $\mathrm{F}=4.56$, $\mathrm{df}=5,775, \mathrm{p} \leq 0.000$ ) respondents.

For female respondents in natural science, the score of those working with Ph.D (4.75) was the highest while the score of undergraduate students (3.73) was the lowest. For female respondents in engineering, the score for other
(4.36) was the highest while those working with Ph.D was the lowest (2.67). For male response, the highest score in natural science was of undergraduate students (4.13), while that of graduate students in doctoral degree (2.79) was the lowest. For male in engineering, the score for other (3.98) was the highest, while that of working with Ph.D (3.29) was the lowest.

Among the APNN countries, Vietnam (2.67) showed the lowest NSP among female while, Taiwan (4.44) the highest. For male, South Korea (3.13) scored the lowest for NSP while Taiwan (4.36) the highest.

<Figure 4-9 Comparative NSP values by APNN Countries (Female and Male)> Blue bars (above) represent data for female, red bars (below) represent data for male.

## 5) Perception of Gender Role Stereotype (PGS)

There were 4 questions to measure the Perception of Gender Role Stereotype. The comprehensive result for these 4 questions are summarized in Table 4-16. The overall average was 3.47 for female and 3.18 for male. The higher score means higher perception of gender role stereotype.
<Table 4-16 Comparison of scores from sub-area 5 by Personal Variable from APNN>

| MAJORFIELD * CURRENTSTATUS | 5 | 4.25 | 0.001 | 0.026 | 5 | 0.19 | 0.967 | 0.001 |
| error | 794 |  |  |  | 769 |  |  |  |

The 2 way ANOVA result show us that there was a significant interaction effect between major field and current status for female respondents ( $\mathrm{F}=4.25, \mathrm{df}=5,794, \mathrm{p} \leq 0.001$ ). For male respondents there was significant effect observed by the major field ( $\mathrm{F}=4.25, \mathrm{df}=1,769, \mathrm{p} \leq 0.039$ ).

For female respondents in natural science, students in a doctoral degree (4.00) gave the highest average score, while that of those working with Ph.D (2.94) was the lowest. In engineering, the score of undergraduate students (3.72) was the highest, while that of those working with MA (3.32) was the lowest. For male, the score of respondents working with Ph.D (3.44) was the highest,
while that of those in others (3.01) was the lowest.
Among APNN countries, Pakistan (2.81) showed the lowest PGS while New Zealand (4.60) the highest among female respondents. A similar pattern was shown among male respondents, where Pakistan (2.62) was the lowest while New Zealand (4.00) was the highest.

<Figure 4-10 Comparative PGS values by APNN Countries (Female and Male)> Blue bars (above) represent data for female, red bars (below) represent data for male.

## 6) Perception of Gender Equity (PGE)

"I believe gender equality will be fully achieved only if women are given equal opportunities as men" was the question used to measure the perception of gender equity (PGE). The result for this question is summarized in Table 4-18. The overall average was 2.24 for female and 2.42 for male. The higher score means the higher perception and/or understanding of the notion of gender equity.
<Table 4-18 Comparison of scores from sub-area 6 by Personal Variable from APNN>

| MAJORFIELD * CURRENTSTATUS | 5 | 4.77 | 0.000 | 0.029 | 5 | 2.30 | 0.044 | 0.015 |
| error | 797 |  |  |  | 774 |  |  |  |

The 2 way ANOVA results show us that there is significant effect of major field for female respondents $(\mathrm{F}=4.81, \mathrm{df}=1,797, \mathrm{p}=0.029$ ). In addition, there existed significant interaction effects between major field and current status for both female $(\mathrm{F}=4.77, \mathrm{df}=5,797, \mathrm{p}=0.000)$ and male $(\mathrm{F}=2.30$, $\mathrm{df}=5,774$, $\mathrm{p}=0.044$ ) respondents.

For female respondents in natural science, the undergraduate students (2.41) gave the highest average score while those studying for a doctoral degree
(1.71) gave the lowest. For female respondents in engineering, the respondents who are working with a Ph.D (3.17) gave the highest score while those in others (1.96) was the lowest.

For male in natural science, the graduate students in masters degree (2.68) gave the highest average score while those studying for a doctoral degree (2.08) gave the lowest. For male in engineering, those working with MA (2.84) scored highest while students in masters degree (2.23) was the lowest.

The cross country comparison results showed that Nepal (1.63) was lowest in PGE while Vietnam (3.74) was the highest among female respondents. Among male respondents, New Zealand (1.83) showed the lowest, while Vietnam (2.92) the highest PGE.

<Figure 4-11 Comparative PGE values by APNN Countries (Female and Male)> Blue bars (above) represent data for female, red bars (below) represent data for male.

## 7) Perception of Gender Barriers for study and research Environment (PGB Env)

There were 7 questions asked to measure the perception of gender barriers during the respondents' study or research. The comprehensive results for these 7 questions under the sub-area 'Perception of Gender Barrier for study and research Environment' (PGB Env) are summarized in Table 4-20. The overall average was 2.58 for female and 2.28 for male. The higher score means the higher perception of gender barrier for study and research environment.
<Table 4-20 Comparison of scores from sub-area 7 by Personal Variable from APNN>

| error | 767 |  |  |  | 745 |  |  |  |

The 2 way ANOVA results show that there was significant effect of major field ( $\mathrm{F}=7.403$, $\mathrm{df}=1,767, \mathrm{p} \leq 0.001$ ) and of current status ( $\mathrm{F}=1.093$, $\mathrm{df}=5$, $767, \mathrm{p} \leq 0.017$ ) for female respondents. There was a difference observed between those in engineering (2.69) and those in natural science (2.42) among female respondents. In addition, female respondents working with a Ph.D showed highest PGB Env (2.71), while students in masters degree (2.52) was lowest. For male respondents significant interaction effect of major field and current status ( $\mathrm{F}=5.987$, $\mathrm{df}=5,745, \mathrm{p} \leq 0.000$ ) was observed.

Among the APNN countries, Japan (2.07) showed the lowest PGB Env while Vietnam (2.99) the highest among female respondents. Similarly, for male respondents, Sri Lanka (1.76) showed the lowest and Vietnam (2.88) the highest.

<Figure 4-12 Comparative PGB Env values by APNN Countries (Female and Male)> Blue bars (above) represent data for female, red bars (below) represent data for male.

Survey Results from ARN

### 4.3 Results from ARN

### 4.3.1 Overall Results of ARN by Sub-area and by Country

The following is a cross-country comparison of the results by sub-area from ARN (see Table 4-22 and Table 4-23)
<Table 4-22 Summary of Results by Sub-area and by Country from ARN>

${ }^{\text {a }}$ ) Perception of Gender Barriers in STEM
b) Direct/Indirect Experience of Gender Barriers in STEM
c) Women Career Outlook in STEM
${ }^{\text {d) }}$ Need for Support policy to overcome gender barrier in STEM
${ }^{\text {e) }}$ Perception of Gender Equity
${ }^{\text {f }}$ Perception of Gender Stereotype
${ }^{\text {g) }}$ Perception of Gender Barriers for the study and research environment in STEM
h), i) Welchi test, as robust ANOVA was applied to analyze the differences between countries, according to variable sample sizes by country.

$<$ Figure 4-13 Summary of Results by sub-areas $>$
Blue bars indicate ARN average of female respondents and red bars indicate ARN average of male respondents.

## - Perception of Gender Barriers in STEM

: Higher score, higher Perception of Gender Barriers (5-point scale).
As shown in Table 4-23, the average scores on the Perception of Gender Barriers ( 2.33 for female respondent, 2.27 for male) indicate that respondents overall do not feel that severe discrimination existed. No statistically significant difference between female and male respondents was observed on average. However, the overall scores for female were slightly higher than those for male for all six questions in this sub-area. Both female and male participants responded with the highest scores of 3.00 and 3.02 respectively for the statement, "Women in STEM receive equal work distribution and work appraisal compared to men of the same qualifications and level" followed by 2.51 (female) and 2.76 (male) on "It is equally difficult for a woman to get a job in the STEM field than for a man with the same qualifications." The lowest score ( 1.88 for female and 1.73 for male) was shown for the statement, "Women in STEM generally receive equal pay for equal work, compared with their equally-qualified male colleagues."

## - Experience of Gender Barriers

Higher score, more Experience of Gender Barriers (5-point scale).
The average score on Experience of Gender Barriers (2.49 for female and 2.29 for male, Table 4-23) indicates that respondents perceive experiences of gender barriers as "neither seen nor heard but recognize the possibility." A statistically significant difference according to t-test was observed between results from female and male respondents ( $\mathrm{t}=3.718, \mathrm{p} \leq 0.000$ ). On average of the six questions, the scores from female participants were higher than those from male. Both female (2.91) and male (2.78) gave the highest score for experience of "Women in STEM being in trouble or leaving work due to her marriage, pregnancy or child care have the same effect on scientists/engineers regardless of their sex for their study, research or project performance, pregnancy or child care", followed by 2.54 (female) and 2.73 (male) on "Women in STEM being sexually harassed (linguistical or physical) or treated unfairly by their colleagues (in class, laboratory, project group, etc)." The question with the lowest score from female respondents among the 6 questions was 2.27 for "Women in STEM being disadvantaged in receiving grade appraisal, research funds or scholarships because they are female.", followed by 2.31 for "Women in STEM being disadvantaged in accessing research equipment or information because they are female." For male respondents, the lowest scored question was 1.74 for "Women in STEM being disadvantaged in accessing research equipment or information because they are female." followed by 1.92 for "Women in STEM being disadvantaged in receiving grade appraisal, research funds or scholarships because they are female." Similar to results from APNN respondents, the above mentioned results indicate that more severe experience of gender barriers are on sexual or biological aspects of women compared to those related to research or work.

## - Career Outlook for Women in STEM

: Higher score means more positive outlook(5-point scale).
As shown in Table 4-23, how career outlook is perceived by young female adults was examined through the statement "I believe things will turn out fine in the future career for women in STEM." The responses were reverse coded such that a higher score indicates a more positive outlook. The average response at 4.41 from female respondents and 4.34 from male showed that both sexes were highly optimistic.

## - Need for Supportive Policy to overcome Gender Barrier

: Higher score means more agreement to supportive policy (5-point scale).
Two questions were asked for this sub-area as shown in Table 4-23. However, unlike the other sub-areas, the two questions are dealt separately rather than by average. The responses to "It is crucial to have strong policy support to solve gender inequality in the STEM field" were reversely coded, and the results showed an average of 4.36 for female respondents and 4.02 for male respondents. Even though the average score is significantly different ( $\mathrm{t}=3.509, \mathrm{p} \leq$ 0.000 ) between female and male respondents, that is female respondents seemed to agree more than male respondents, both scores reflect a high demand for supportive policy. The scores for introducing a quota system or affirmative action plan, on the other hand, were 3.84 for female respondents and 3.51 for male respondents with a statistical significant difference between the sexes $(\mathrm{t}=2.610, \mathrm{p} \leq 0.009)$. It is noteworthy that both female and male young scientists and engineers responded with a strong need for policy to overcome gender barriers yet the responses to the introduction of a quota system were not as strong.

## - Perception of Gender Role Stereotype

: Higher score means more progressive gender role perception
To measure the respondents' attitudes towards gender role stereotype within their family or social environment, four questions were asked as shown in Table 4-23. The average response to the four questions was 2.17 for female and 2.05 for male respondents. Compared to the results from APNN, ARN respondents seemed to be more conservative on the perception of gender role. The most progressive attitude was found in "In a relative sense, men are rational while women are emotional and thus, they out to complement each other by doing what is appropriate for their sex" with an average of 2.63 (female) and 2.34 (male). However respondents seem to somewhat agree on patriarchal power within the family. The lowest score was for "Women are born to have a way of caring children that men are not capable of in the same way." with scores of 1.66 from female and 1.49 from male respondents.

## - Perception of Gender Equity

: Higher score means higher gender equity perception
This sub-area consisted of one question asking whether equal opportunities can be a sufficient condition for achieving gender equality. The question was to examine the understanding of the gender equality concept ${ }^{1)}$. The average score from both female and male respondents are relatively low at 2.20 for female and 2.26 for male respondents. Similar to the observation among APNN members, ARN members also reveal a weak understanding of gender equity.

## - Perception of Gender Equality for study and research Environment in STEM

: Higher score means higher perception of discrimination for study and research environment in STEM

This sub-area has been newly added this year because the respondents were those in their twenties and mostly expected to be in school or research labs. The 7 questions in this sub-area aimed to capture overt / covert discriminatory reality that may exist in educational or research environment for female students or young adults ${ }^{2}$ ). The average score for the seven questions was 2.79 for female and 2.67 for male (Table 4-23). The strongest perception from female respondents was shown in "Women receive the same social evaluation and respect to men as scientists and engineers" (3.84). The second strongest was for "Female students in STEM are intimidated in the laboratory or in classes because they are female." with scores of 3.66 . However the other 5 statements showed relatively less perception on gender equality with average scores ranging from 1.65 to 3.60 . As for male respondents, the highest score was 3.57 for "Marriage, pregnancy or child care have the same effect on scientists/engineers regardless of their sex for their study, research or project performance," followed by 3.42 for the two statements, "Women receive the same social evaluation and respect to men as scientists and engineers" and "Female students in STEM are intimidated in the laboratory or in classes because they are female." The rest of the statements scores ranged from 1.51 to 3.07 similar to female responses. Significant difference was observed between sexes in three statements. One was "Women receive the same social evaluation to men as scientists or engineers" ( $\mathrm{t}=3.518, \mathrm{p} \leq 0.000$ ) where both sexes showed

[^7]high perception of gender equality but female respondents showing higher. The second statement was "Women equally receive the appraisal or award for the outcome of their project or research" $(\mathrm{t}=2.024, \mathrm{p} \leq 0.044)$ where both sexes showed low perception of gender equality but male respondents showing even lower. The third statement was "Female students in STEM are intimidated in the laboratory or in classes because they are female." $(\mathrm{t}=2.212, \mathrm{p} \leq 0.027)$

### 4.3.2 Analyses of Variables by sub-areas (ARN)

## 1) Perception of Gender Barriers

Table 4-24 lists the average scores of 6 questions for sub-area 1 according to their major field and current status for both sexes. The results of 2 way Analyses of Variances (ANOVA) are shown in Table 4-25. No significant effect by major field nor by current status was observed for both female and male respondents in the perception of gender barriers for ARN respondents.
<Table 4-24 Comparison of scores from Sub-area 1 by Personal Variable from ARN>

| Major Field |  | Female |  |  | Male |  |  |

Figure 4-14 shows the comparative PGB scores by ARN countries that participated in this survey. For female respondents, Uganda (2.19) showed the lowest PGB followed by Nigeria (2.26) and Kenya (2.68) among female respondents. For male respondents, Kenya (2.25) showed the lowest followed by Uganda (2.27) and Nigeria (2.27).

<Figure 4-14 Comparative PGB values by ARN Countries (Female and Male)> Blue bars (left) represent data for female, red bars (right) represent data for male.

## 2) Experience of Gender Barriers

There were 6 questions to measure the direct and/or indirect Experience of Gender Barriers. For this sub-area, women and men were asked different questions: women were asked of their direct experience while men were asked if they have seen/heard of women's experience. The comprehensive result for these 6 questions was categorized as 'Experience of Gender Barriers' (EGB) and Table 4-26 lists the average scores of 6 questions for sub-area 2 according to their major field and current status. The overall average was 2.49 for female and 2.29 for male. The higher score means the more direct (female) or indirect (male) Experience of Gender Barriers.

The scores by female respondents tended to be higher than those of male respondents. The results of 2 way Analyses of Variances (ANOVA) are shown in Table 4-27. For female respondents, the current status had a significant effect on scores of EGB ( $\mathrm{F}=2.46, \mathrm{df}=5,187, \mathrm{p} \leq 0.035$ ). Moreover, a significant interaction effect between major field and current status of respondents ( $\mathrm{F}=4.02$, $\mathrm{df}=4,187, \mathrm{p} \leq 0.004$ ) was observed. The score of respondents who are working with a Ph.D (2.39) was the lowest in natural science, while that of graduate student in master degree (2.25) was the lowest in engineering. The highest score
in natural science was that of the graduate students in master degree (3.20), while the score of students working with a doctoral degree (3.67) was the highest in engineering. However, no significant effect by major field, current status, nor interaction effect of major field and current status was observed for male respondents.
<Table 4-26 Comparison of scores from Sub-area 2 by Personal Variable from ARN>

| error | 187 |  |  |  | 276 |  |  |  |

Figure $4-15$ is the cross country comparison of EGB in ARN countries. For female respondents, the scores were Nigeria (2.45), Kenya (2.51) and Uganda (2.67). For male respondents, Kenya (1.89) was the lowest followed by Uganda (1.99) and Nigeria (2.41).

<Figure 4-15 Comparative EGB values by ARN Countries (Female and Male)> Blue bars (left) represent data for female, red bars (right) represent data for male.

## 3) Career Outlook

Table 4-28 lists the average scores for sub-area 3. The overall average was 4.41 for female and 4.34 for male respondents. The higher score means more positive prospect on career outlook for women in STEM.

The 2 way ANOVA resulted in a significant effect from major field ( F $=7.03$, $\mathrm{df}=1,188, \mathrm{p} \leq 0.009$ ) for female respondents while that from current status ( $\mathrm{F}=5.30,279$, $\mathrm{df}=5, \mathrm{p} \leq 0.000$ ) and from interaction effect by major field and current status ( $\mathrm{F}=6.75, \mathrm{df}=5,279, \mathrm{p} \leq 0.000$ ) for male respondents.

For female respondents, those in engineering (4.59) showed significantly higher scores in CO than those in natural science (4.27). For male respondents in natural science, the score of graduate students in master degree (4.73) was the highest, followed by that of respondents in other status (4.71) and that of undergraduate students (4.69). The score of respondents who are working with a Ph.D (3.50) was the lowest. For male respondents in engineering, the score of those in "others" status (5.00) was the highest followed by graduate students in doctoral degree (4.59), undergraduate students (4.47), and by those working with a Ph.D (4.37). Those working with a MA (3.30) was the lowest in engineering.

Figure $4-16$ is the cross country comparison of CO in ARN countries. The scores for both female and male were lowest for Nigeria (4.32, 4.15 respectively) followed by Kenya (4.50, 4.85, respectively) and Uganda (4.73, 4.85, respectively).
<Table 4-28 Comparison of scores from Sub-area 3 by Personal Variable from ARN>

## 4) Need for Supportive Policy

Table 4-30 lists the average scores for the first question of sub-area 4. The results are reversely coded to show that higher score means higher agreement to the need for supportive policy. The overall average was 4.36 for female and 4.02 for male.

In general, the score by female respondents was higher than that of male respondents. The 2 way ANOVA results show that a significant effect from current status ( $\mathrm{F}=3.01$, $\mathrm{df}=5,188, \mathrm{p} \leq 0.012$ ) was observed in female, while from major field ( $\mathrm{F}=10.93 \mathrm{df}=1,279, \mathrm{p} \leq 0.001$ ), current status ( $\mathrm{F}=2.42 \mathrm{df}=5,279, \mathrm{p} \leq$ 0.036 ) as well as a significant interaction effect between major field and current status ( $\mathrm{F}=2.34 \mathrm{df}=5,279, \mathrm{p} \leq 0.042$ ) for male respondents.

For female respondents, the score of female graduate students in master degree (4.84) was the highest, followed by that of other status (4.78), that of the respondents who are working with a Ph.D (4.50) and of undergraduate students (4.31); the lowest score was from respondents who are working with a MA (3.20).

For male respondents in natural science, the score of other status (4.71) was the highest while that of graduate students in doctoral degree (3.77) was the lowest. For male respondents in engineering, the score of graduate student in master degree (4.20) was the highest and that of other status was lowest (2.00).

As shown in figure below, the score of Nigeria (4.14) was the lowest while Uganda (4.81) was the highest for female from ARN. For male, the score from Nigeria (3.83) was the lowest, while that of Kenya (4.62) was the highest.

<Figure 4-17 Comparative NSP values by ARN Countries (Female and Male)> Blue bars (left) represent data for female, red bars (right) represent data for male.

## 5) Perception of Gender Role Stereotype

There were 4 questions to measure the Perception of Gender Role Stereotype. The comprehensive result for these 4 questions are summarized in Table 4-32. The overall average was 2.17 for female and 2.05 for male. The higher score means higher perception of gender role stereotype. The scores for both male and female tend to be low in this sub-area.

The 2 way ANOVA results show us that current status had a significant effect for female respondents ( $\mathrm{F}=2.72, \mathrm{df}=5,188, \mathrm{p} \leq 0.021$ ). For male respondents there was no significant effect observed by major field nor current status.

Among the participating ARN countries, Nigeria (1.94, 1.94, respectively) was the lowest, while of Kenya (3.13, 2.41, respectively) was the highest for both female and male respondents.

## 6) Perception of Gender Equity

"I believe gender equality will be fully achieved only if women are given equal opportunities as men" was the question used to measure the perception of gender equity (PGE). The result for this question is summarized in Table 4-34. The overall average was 2.20 for female and 2.26 for male. The higher score means the higher perception and/or understanding of the notion of gender equity.

The 2 way ANOVA results show us that there is significant effect of major field ( $\mathrm{F}=7.20, \mathrm{df}=1,188, \mathrm{p}=0.008$ ), current status $(\mathrm{F}=3.86, \mathrm{df}=5,188$, $\mathrm{p}=0.002$ ) as well as interaction effect between major field and current status ( $\mathrm{F}=3.16, \mathrm{df}=4,188, \mathrm{p}=0.015$ ) for female respondents. For male respondents, no significant effect by major field nor current status was observed.

For female respondents in natural science, the respondents who are working with a MA (2.33) showed the highest while those in other status (1.20) the lowest score. For female respondents in engineering, the respondents who are working with a Ph.D (5.00) showed the highest score while those in other status (1.50) the lowest score.

The cross country comparison results showed Kenya (1.40) with the lowest score in PGE while that of Nigeria (2.56) was the highest for female respondents. For male, Kenya (1.81) showed the lowest while Uganda (2.55) the highest.
<Table 4-34 Comparison of scores from Sub-area 6 by Personal Variable from ARN>

<Figure 4-19 Comparative PGE values by ARN Countries (Female and Male)> Blue bars (left) represent data for female, red bars (right) represent data for male.

## 7) Perception of Gender Equality for study and research Environment

There were 7 questions asked to measure the perception of gender barriers during the respondents' study or research. The comprehensive results for these 7 questions under the sub-area 'Perception of Gender Barrier for study and research Environment' (PGB Env) are summarized in Table 4-36. The overall average was 2.79 for female and 2.67 for male. The higher score means the higher perception of gender barrier for study and research environment.

The 2 way ANOVA results show that there was no significant effect of major field nor of current status for female respondents. For male respondents, the current status had an effect ( $\mathrm{F}=8.165$, $\mathrm{df}=5,279, \mathrm{p} \leq 0.000$ )

Among the ARN participating countries, Uganda (2.40) scored the lowest, while Nigeria (2.89) the highest among female respondents. For male, the average score of Kenya (1.81) was the lowest while, that of Nigeria (2.97) was the highest.

## Comparison of Results between APNN and ARN

### 4.4 Comparison of Results between APNN and ARN

### 4.4.1 Comparing Responses between APNN and ARN by sub-area

This section compares and summarizes the overall results between responses from APNN versus ARN members. Table 4-38 and Figure 4-21 shows the average scores by sub-area from APNN and ARN respondents. Results of $t$-test are shown where $p \leq 0.05$ was considered statistically different.

All scores except for PGE and PGB Env from female were significantly different between APNN and ARN where scores were higher in APNN for PGB and PGS in both male and female. ARN scored higher for CO and NSP for both sexes.

<Figure 4-21 APNN and ARN results by Sub-area>
Blue bars indicate ARN average of female respondents and red bars indicate ARN average of male respondents.

### 4.4.2 Comparing scores by sexes between APNN and ARN

A more detailed comparison of responses by individual questions are shown in Table 4-39 (for female) and Table 4-40 (for male).

Responses to the six questions under the sub-area 'Perception of Gender Barriers' (PGB) was generally higher in score by APNN than ARN except for one question for both female and male respondents. Responses to "Women in STEM receive equal work distribution and work appraisal compared to men of the same qualification and level" for both male and female respondents showed higher scores by ARN members.
'Perception of Gender Role Stereotype' (PGS), also showed significantly higher scores from APNN, for both female ( $3.47, \mathrm{t}=16.030, \mathrm{p} \leq 0.000$ ) and male (3.18, $\mathrm{t}=20.879, \mathrm{p} \leq 0.000$ ). Although not statistically significant, another sub-area where APNN scored higher was Perception of Gender Equity. The comprehensive score was significantly higher from APNN, for both female (2.24 of APNN, 2.20 of ARN) and male ( 2.42 of APNN, 2.26 of ARN). However, for both networks, it is noteworthy that the score for male was higher than that of female.

The sub-areas showing higher scores from ARN are as follows:
Respondents from ARN experienced more gender barriers than those from APNN for both female $(\mathrm{t}=-2.543 \mathrm{p} \leq 0.011)$ and male $(\mathrm{t}=-2.415, \mathrm{p} \leq 0.016)$. The comprehensive score on 'Experience of Gender Barriers' (EGB) of APNN was 2.35 for female, 2.20 for male while that of ARN were 2.49 for female and 2.29 for male.

As for Career Outlook, the responses from ARN was more positive than those from APNN. The difference was statistically significant for both female $(\mathrm{t}=-7.345 \mathrm{p} \leq 0.000)$ and male $(\mathrm{t}=-4.449 \mathrm{p} \leq 0.000)$. In addition, a stronger need for policy was shown by ARN for both female ( $\mathrm{t}=-4.890 \mathrm{p} \leq 0.000$ ) and male $(\mathrm{t}=-2.962 \mathrm{p} \leq 0.003)$. ARN also scored higher on the question on introducing a quota system or affirmative action for both female (3.70 from APNN, 3.84 from ARN, but not statistically significant) and male ( 3.25 from APNN and 3.51 from ARN, $\mathrm{t}=-2.664 \mathrm{p} \leq 0.008$ ).

The sub-area, 'Perception of Gender Equality for study and research Environment in STEM' (PGB Env) also showed ARN with higher scores. ARN (2.79) showed a slightly higher score than that of APNN (2.58) with significant difference from female respondents. ( $\mathrm{t}=-3.995, \mathrm{p} \leq 0.000$ ). And, for male, the score from ARN (2.67) was higher than that from APNN (2.28) with a significant difference ( $\mathrm{t}=-8.045 \mathrm{p} \leq 0.000$ ).

In summary, our respondents from APNN tended to perceive more gender barrier than those from ARN, in general. However, more direct or indirect experience of gender barrier was shown by ARN. APNN respondents tended to be more progressive in their attitude toward the Perception of Gender

Role Stereotype than ARN respondents. However, ARN members showed a more positive career outlook than those from APNN.
<Table 4-39 Comparison of Results by Female Respondents between APNN and ARN (812 from APNN, 199 from ARN, person)>

The questions are evaluated on a Likert-type scale (5 points).

1. Perception of Gender Barriers : Higher score means higher perception of gender barriers in STEM
2. Direct/Indirect Experience of Gender Barriers : Higher score means more experiences of gender barrier in STEM For the same questions, different answering set was provided to the respondents depending on their sex.
-Female respondent : 1. Never experienced, seen nor heard from others, 2. Neither seen nor heard but recognize the possibility, 3. Heard from others, 4. I have seen others experience, 5. Experienced for myself
-Male respondent : 1. Never experienced, seen nor heard from others, 2. Neither seen nor heard but recognize the possibility, 3. Heard from others about unknown person's case, 4. Heard from my colleague or known person's experience, 5. I have seen someone experience
3. Career Outlook for Women in STEM : Higher score means more positive prospect (reverse coded)
4. Need for policy to overcome 'gender barriers' : Higher score means more agreement (reverse coded)

5 Perception of Gender Role Stereotype: The higher the score, the more progressive attitude towards gender role stereotype
6. Perception of Gender Equity : Higher score means higher perception or understanding of gender equity
7. Perception of Gender Equality for study \& research environment: Higher score means higher perception (7-7 was reverse coded)

The questions are evaluated on a Likert-type scale ( 5 points).

1. Perception of Gender Barriers : Higher score means higher perception of gender barriers in STEM
2. Direct/Indirect Experience of Gender Barriers : Higher score means more experiences of gender barrier in STEM

For the same questions, different answering set was provided to the respondents depending on their sex.
-Female respondent : 1. Never experienced, seen nor heard from others, 2. Neither seen nor heard but recognize the possibility, 3. Heard from others, 4. I have seen others experience, 5. Experienced for myself
-Male respondent : 1. Never experienced, seen nor heard from others, 2. Neither seen nor heard but recognize the possibility, 3. Heard from others about unknown person's case, 4. Heard from my colleague or known person's experience, 5. I have seen someone experience
3. Career Outlook for Women in STEM : Higher score means more positive prospect (reverse coded)
4. Need for policy to overcome 'gender barriers' : Higher score means more agreement (reverse coded)

5 Perception of Gender Role Stereotype: The higher the score, the more progressive attitude towards gender role stereotype
6. Perception of Gender Equity : Higher score means higher perception or understanding of gender equity
7. Perception of Gender Equality for study \& research environment : Higher score means higher perception (7-7 was reverse coded)

## Conclusion \& Suggestions

## 5. Conclusion and Suggestions

This policy report presented various indices developed and analyzed by the United Nations Development Program (UNDP) and the World Economy Forum (WEF) to measure current status of human resources development. Those are Human Development Index (HDI), Inequality-adjusted Human Development Index (IHDI), Gender Development Index (GDI), Gender Inequality Index (GII) and global Gender Gap Index (GGI). The first four indices are from the UNDP and the last index, GGI is from the WEF. Analyzing biannually these indices for countries which belong to the Asia Pacific Nations Network (APNN) under INWES has been an important task of this research since 2014. In this year's analysis, one of the UNDP's indices, IHDI was included to figure out the inequality effect and the human resources development for countries belonging to the African Regional Network (ARN) under INWES was reviewed at first time since last 5 years.

Among APNN countries, Australia shows the best achievement in HDI, IHDI, and GDI. Except Australia, all APNN member countries exhibit more than $10 \%$ of loss due to inequality in HDI. Korea is the best among APNN in GII with value of 0.067 , while the average value of GII for APNN countries except Taiwan is 0.324 . Note that the lower value of GII is the better gender equality. On the other hand, New Zealand closes the gender gap $79 \%$ which is the best in GGI among APNN countries. Interestingly, Korea's GGI value is only 0.650 that places in the lowest group in not only APNN but also worldwide. This discrepancy between GII and GGI evaluation for Korea comes from measurement. The UNDP's GII has 5 indicators, while the WEF's GGI has 14 indicators. It can be understood that Korea seems to show gender equality at a glance. However, when looking into the details, quite large gender gaps are shown. The indices suggest that Bangladesh, India, Mongolia, Nepal. Pakistan, and Vietnam need more efforts for human resources development though these countries except Pakistan close the gender gap more than Korea and Japan. Japan and Korea show similar pattern that is a high achievement in UNDP's indices but a wide gender gap in WEF's GGI. On average $68.1 \%$ of the gender gap is closed in the APNN countries.

Among the ARN countries, Algeria shows the best achievement in the UNDP's HDI with value 0.745 and world ranking 83 out of 188 countries. However, most of the ARN countries mark the HDI values less than 0.5. The losses due to inequality in HDI are more than $30 \%$ for almost every countries in the ARN. Botswana is the only country that GDI belongs to the group 1. Note that the group 1 in GDI means $|G D I-1| \times 100 \leq 2.5$. The gender gap in Botswana turns out to be relatively narrow by closing $72 \%$. Uganda and Tanzania also close the gender gap more than $70 \%$. The GII values for all the ARN countries are quite large with the average value of 0.545 which is much higher than the APNN's average of 0.324 . Such a severe gender inequality comes from high maternal mortality ratio and also high adolescent birth rate. On average 437 women die from pregnancy related causes for every 100,000 live
births and the average adolescent birth rate is 93.0 births per 1,000 women of ages $15-19$. As easily expected, the economic development needs human resources development. The gender gap in the ARN countries is closed on average $67.3 \%$ following the WEF's report. The average value is lower than the world average $68 \%$. Botswana shows no gender gap in the dimension of education attainment and Kenya turns out to exhibit the narrowest gap in the dimension of health and survival.

Another important part of this report is about a joint international survey. KWSE has been conducting a joint international survey annually among members of the APNN (Asia and Pacific Nations Network) since 2014. The survey has been a meaningful endeavor in that it explored the state of glass ceiling and other gender barriers women in the STEM field face. Science has long been regarded as objective and value-neutral. However, as Robert Young(1987) said a while ago science is not value-free and people-proof:

> Science is not something in the sky, not a set of eternal truths waiting for discovery. Science is a practice. There is no other science than the science that gets done. The science that exists is the record of the questions that has occurred to scientists to ask, the proposals that get funded, the paths that get pursued... Whether or not they get asked, how far they get pursued, are matters for a given society, its educational system, its patronage system and its funding bodies (Young, 1987: 16-17).

The assumption that scientific and technological activities are based on the principle of rationality and thus, there is no room for any sort of biases, including gender bias, has been proven to be a myth. Moreover, meritocracy prevails in this field, implying that anyone can achieve what she/he wants if only she/he thrives hard enough. However, it has been argued recently that although the number of women entering into the STEM field has been steadily increasing, the paucity of women in decision-making positions and male dominated culture in the work-sites (e.g., laboratories) have not changed much. The overall working environment in the STEM field is still very much inconsiderate of women scientists' and engineers' specific needs. That can be attributed to, among other things, a collective ignorance as to what constitute discriminations against women. Gender-sensitive innovation is called for in terms of laws and institutions as well as peoples' perceptions and behaviors regarding gender so that women scientists and engineers are guaranteed equal rights in their work and career.

The 2018 survey, though it was a continuation of the previous surveys, was unique in two aspects. First, it focused on younger/future generation scientists and engineers in their 20 s and 30 s . It was because that although it may seem as though gender barriers are disappearing, close interviews and discussions with younger generations reveal that barriers remain untacked. Second, the 2018 survey included respondents not only from the APNN but also
from the African Network of INWES, ARN with an aim to compare gender state between two regions.

Analysis of survey data revealed that gender differences were statistically significant among the APNN respondents. Specifically, female scientists and engineers in this region perceived and experienced more gender barriers/discriminations than their male counterparts. Among six different items on the perception of gender barriers, APNN women perceived 'equal work distribution and equal appraisal' and 'equal pay for equal work' to be the most serious. Of the six items asking about the experiences of various kinds of gender discriminations, the highest response was on the item on women having trouble or having to leave work due to marriage, pregnancy or child care. This calls for strong policy measures to eradicate any discriminatory practices women have to face in relation to marriage and children and to ease their tension for maintaining the work-life balance in APNN countries.

Also, APNN women's perception of gender barriers in the research/lab environment was higher than that of males ( 2.58 vs. 2.28). Here again, the highest response among the seven items included in this sub-scale, was on the item addressing women scientists and engineers having difficulties in relation to marriage, pregnancy and child care. Understandably, the need for policy to solve gender inequality in the STEM field was higher among females than for males ( 3.99 vs. 3.78 ). Also, women in the APNN agreed more to the introduction of a quota system or other affirmative action programs than their male counterparts (3.70 vs. 3.25).

On the other hand, male respondents were more optimistic than females toward future career of women female scientists and engineers, implying males are not as sensitive as females of gender barriers women confront throughout their career. Lastly, females reported more progressive attitudes toward gender role stereotypes than males as shown in the previous studies (e.g., Kim \& Kim, 1999). Particularly, women in the STEM field in the APNN showed the most progressive attitude on the item addressing power relations between husband and wife and the item regarding who should be the breadwinner for the family ( 3.73 and 3.71 respectively). These results seem to reflect, to some extent, that APNN women in their 20s and 30s reject patriarchal power structure between wives and husbands and traditional role of husband as a breadwinner.

For the ARN respondents, the pattern of gender differences was similar to that of APNN respondents, but the differences were not as much explicit as those for the APNN counterparts with two exceptions. For the need for policy to solve gender inequality in the STEM field and experiences of gender barriers, ARN respondents showed bigger gender differences than their APNN counterparts. For the participants from the ARN, gender differences were not big enough to reach a statistically significant level for the perception of gender barriers and future career outlook.

Next, female respondents from the APNN showed a higher perception of gender barriers and had much more progressive attitudes toward gender role stereotypes than females from the ARN (2.70 vs. 2.33; 3.47 vs. 2.17 respectively). One can imagine that women with progressive gender role ideology would be more sensitive to gender barriers in the society. Among different kinds of gender barriers the largest gap between APNN women and ARN women was found in the item dealing with 'the equal pay for the equal job' ( 2.87 for APNN, 1.88 for ARN), implying that the principle of the equal pay for the equal job has not been put into practice among the ARN countries.

Among four items assessing gender role stereotypes, the biggest gap was found between women from the APNN and from the ARN on the item addressing women born to fit child care unlike men (3.39 APNN, 1.66 ARN), followed by the item on men should be the primary breadwinner of households (3.71 APNN, 2.20 ARN). ARN females were significantly more conservative than APNN females regarding who should be the carer of the children and who should be the breadwinner for the family. These two kinds of ideology have a tendency to reinforce each other and form a vicious circle, thus strengthening patriarchal family relations and sustaining women's lower position not only within the family but also in the society. A systematic training is needed to explore and change patriarchal beliefs ARN women had internalized in their early socialization process.

On the contrary to the perception of gender barriers, female scientists and engineers from the ARN reported more experiences of gender discriminations than APNN females ( 2.49 vs. 2.35). And yet, they had a brighter outlook for their future career than females among the APNN countries ( 4.41 vs. 3.82). Both groups of women strongly confirmed to the need for policy to eradicate gender discriminations, but women from the ARN considered policy support more important than their APNN counterparts (4.36 vs. 3.99). Also, it should be noted that both female groups thought institutions such as a quota system or other affirmative action plans are appropriate ( 3.84 for ARN, 3.70 for APNN).

When responses were compared between males from the two regions, the pattern of regional differences was similar to that of female respondents. APNN males showed a higher perception of gender barriers ( 2.56 vs. 2.27 ) and had much more progressive attitudes toward gender role stereotypes than ARN males ( 3.18 vs. 2.05). The ARN males reported a higher level of (indirect) experiences of gender discriminations than the APNN males ( 2.29 vs. 2.20 ). On the other hand, the ARN males were less aware of gender barriers in study/research environment than the APNN males( 2.67 vs. 2.28 ). Concomitantly, the ARN male scientists and engineers had a more optimistic outlook for women scientists' and engineers' future career than the APNN males (4.34 vs. 4.03). Also, ARN males perceived the importance of policy support to solve gender inequality more than APNN males (4.02 vs. 3.78).

Based on the above-mentioned results, one can conclude that a
comprehensive policy scheme needs to be developed and put into action to eradicate gender barriers women scientists and engineers face. First of all, institutes should examine whether there are unequitable elements in their HR practices, including hiring, evaluating or promoting. Measures to reduce the gender pay gap and to eradicate negative consequences of marriage, pregnancy or child care are urgent. Many women, even after getting advanced degrees in STEM fields, drop out of research/professional careers primarily because marriage, pregnancy or child care. Motherhood is incompatible with research career when there is not a strong support system to maintain work-life balance. Especially, for many women the burden of child care is so detrimental that they either have to leave the work or give up on having children. The effect of children on women scientists' and engineers' career is so remarkable that it eclipses other factors in contributing to women's low income level as well as under-representation in this field. Therefore, some universities adopt policies to alleviate the pressures from mothering while they are working toward tenure by, for instance, creating a part-time tenure track. In the same context, some research institutes adopt flexible work hours or allow more freedom to work from home. It should be kept in mind that work-life balance is not just married women's issues but everyone's issue. It is because that policy measures limited to married women often come with negative costs such as reduction of payment or delay of promotion.

Further, it will be worthwhile to discuss ways to introduce affirmative action programs such as a quota system to solve gender inequality in the STEM field. Last but not least, gender training programs should be provided for both male and female scientists and engineers to help them overcome outdated gender role ideology. Males than females and those in the ARN region than the APNN region will benefit more from these initiatives as the former groups show more conservative attitudes toward gender role ideology. Campaigns such as the 'HeForShe' run by the UNWomen should be extended to the STEM field to help men become supporters of gender equality.

Recommendations delineated above can be summarized within a framework for gender mainstreaming ${ }^{2}$ ) of the STEM field. There are three steps of gender mainstreaming: (1) mainstreaming of women, (2) mainstreaming of gender perspective and (3) transforming the mainstream.

The first element, the mainstreaming of women, is a political aspect. It is an issue of equal representation and having enough women in decision-making positions. This can be achieved by improving HR practices that are discriminatory against women, providing support for work-life balance,

[^8]introducing affirmative action programs, etc. The paucity of women scientists renders S\&T as a field ignorant of or slow to react to women's needs or gender issues. Consequences will include, for example, the lack of interests in investing in technologies for women's agricultural, domestic and professional activities (Kim, et. al., 2000).

Second element, mainstreaming gender perspectives in policies and programs is a technical aspect. It is to make sure that differential voices and needs of women and men are equally incorporated. For this gender training should be provided for public officials and those who work in the STEM field. Also, tools such as gender impact assessment(GIA) ${ }^{3)}$ and gender budget(GB)4) are very much helpful. The Republic of Korea has institutionalized both GIA and GB with strong legal foundations and thus can paly a key role in sharing experiences with members of the APNN and the ARN networks and helping them implement those mechanisms.

The third element of gender mainstreaming is about transforming the mainstream system to be more gender responsive. This can be done, for example, by establishing a gender division within the Ministry of Science, universities or research institutes to address gender issues and to initiate institutional as well as cultural changes. This framework can be applied in the future survey to monitor gender state in terms of policies and institutions of member countries of the APNN and the ARN networks.

Appendix

## Appendix 1. Survey Results by Participating Country (APNN)

Individual country results of the 10 APNN countries are shown herein in table format. Among the 12 countries that have participated in this year's survey, India and Malaysia are not included in this section due to insufficient number of responses. The three tables for each country are: 1) Results of female responses of the country in comparison with APNN female average (which excludes the particular country). For example, for Nepal, the average score from female respondents are compared with those from APNN countries excluding those from Nepal; 2) Results of male responses of the country in comparison with APNN average (which excludes the particular country). For example, for Nepal, the average score from male respondents are compared with those of APNN countries excluding those from Nepal; 3) Comparison of results from female and male respondents of the country. For example for each question results from female respondents of Nepal is compared with those from male respondents of Nepal. A $p$ value of less than 0.05 indicates a statistically significant difference.

## A1.1 Nepal

1) Comparison with Other APNN Member Countries : Female Response

<Table A1-1 Results from Female Respondents of Nepal ( $\mathrm{n}=48$ ) compared with Average of APNN without Nepal>

The questions are evaluated on a Likert-type scale ( 5 points).

1. Perception of Gender Barriers : Higher score means higher perception of gender barriers in STEM
2. Direct/Indirect Experience of Gender Barriers : Higher score means more experiences of gender barrier in STEM For the same questions, different answering set was provided to the respondents depending on their sex.
-Female respondent: 1. Never experienced, seen nor heard from others, 2. Neither seen nor heard but recognize the possibility, 3. Heard from others, 4. I have seen others experience, 5. Experienced for myself.
-Male respondent : 1. Never experienced, seen nor heard from others, 2. Neither seen nor heard but recognize the possibility, 3. Heard from others about unknown person's case, 4. Heard from my colleague or known person's experience, 5 . I have seen someone experience
3. Career Outlook for Women in STEM : Higher score means more positive prospect (reverse coded)
4. Need for policy to overcome 'gender barriers' : Higher score means more agreement (reverse coded)

5 Perception of Gender Role Stereotype: The higher the score, the more progressive attitude towards gender role stereotype
6. Perception of Gender Equity : Higher score means higher perception or understanding of gender equity
7. Perception of Gender Equality for study \& research environment : Higher score means higher perception

## 2) Comparison with Other APNN Member Countries : Male Response

$<$ Table A1-2 Results from Male Respondents of Nepal ( $\mathrm{n}=48$ ) compared with Average of APNN without Nepal>

<Table A1-2 Results from Male Respondents of Nepal ( $\mathrm{n}=48$ ) compared with Average of APNN without Nepal>

| Classifications | Question |  |  |  |  |  |  |  |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |

The questions are evaluated on a Likert-type scale (5 points).

1. Perception of Gender Barriers : Higher score means higher perception of gender barriers in STEM
2. Direct/Indirect Experience of Gender Barriers : Higher score means more experiences of gender barrier in STEM

For the same questions, different answering set was provided to the respondents depending on their sex.
-Female respondent : 1. Never experienced, seen nor heard from others, 2. Neither seen nor heard but recognize the possibility, 3. Heard from others, 4. I have seen others experience, 5. Experienced for myself.
-Male respondent : 1. Never experienced, seen nor heard from others, 2. Neither seen nor heard but recognize the possibility, 3. Heard from others about unknown person's case, 4. Heard from my colleague or known person's experience, 5. I have seen someone experience
3. Career Outlook for Women in STEM : Higher score means more positive prospect (reverse coded)
4. Need for policy to overcome 'gender barriers' : Higher score means more agreement (reverse coded)

5 Perception of Gender Role Stereotype: The higher the score, the more progressive attitude towards gender role stereotype
6. Perception of Gender Equity : Higher score means higher perception or understanding of gender equity
7. Perception of Gender Equality for study \& research environment : Higher score means higher perception

## 3) Comparison of results between Female and Male respondents ( $\mathrm{n}=96$ )

|  | 4 | Dealing with the funding donors (those providing funding for the project) in terms of administrative or budget process of the research project is equally fair regardless of the sex of the applicant | N.Zealand <br> $\sim$ N.Zealand | $\begin{aligned} & 2.69 \\ & 2.43 \end{aligned}$ | $\begin{aligned} & 0.897 \\ & 1.047 \end{aligned}$ | 1.793 | 0.079 |
|  | 5 | Women receive the same social evaluation and respect to men as scientists or engineers (by their colleagues, professor, funding donors, academic association, scientific society etc) | N.Zealand <br> $\sim$ N.Zealand | $\begin{aligned} & 3.21 \\ & 2.65 \end{aligned}$ | $\begin{aligned} & 1.071 \\ & 1.160 \end{aligned}$ | 3.077 | 0.002 |
|  | 6 | Marriage, pregnancy or child care have the same effect on scientists/engineers regardless of their sex for their study, research or project performance. | N.Zealand <br> $\sim$ N.Zealand | $\begin{aligned} & 3.67 \\ & 3.07 \end{aligned}$ | $\begin{aligned} & 1.426 \\ & 1.378 \end{aligned}$ | 2.720 | 0.007 |
|  | 7 | Female students in STEM are intimidated in the laboratory or in classes because they are female. | N.Zealand <br> $\sim$ N.Zealand | $\begin{aligned} & 2.90 \\ & 2.74 \end{aligned}$ | $\begin{aligned} & 1.284 \\ & 1.205 \end{aligned}$ | 0.871 | 0.384 |
|  |  | Average | N.Zealand <br> ~N.Zealand | $\begin{aligned} & 2.90 \\ & 2.56 \\ & \hline \end{aligned}$ | $\begin{aligned} & 0.766 \\ & 0.768 \\ & \hline \end{aligned}$ | 2.783 | 0.006 |

The questions are evaluated on a Likert-type scale ( 5 points).

1. Perception of Gender Barriers : Higher score means higher perception of gender barriers in STEM
2. Direct/Indirect Experience of Gender Barriers: Higher score means more experiences of gender barrier in STEM For the same questions, different answering set was provided to the respondents depending on their sex.
-Female respondent: 1. Never experienced, seen nor heard from others, 2. Neither seen nor heard but recognize the possibility, 3. Heard from others, 4. I have seen others experience, 5. Experienced for myself.
-Male respondent : 1. Never experienced, seen nor heard from others, 2. Neither seen nor heard but recognize the possibility, 3. Heard from others about unknown person's case, 4. Heard from my colleague or known person's experience, 5 . I have seen someone experience
3. Career Outlook for Women in STEM : Higher score means more positive prospect (reverse coded)
4. Need for policy to overcome 'gender barriers' : Higher score means more agreement (reverse coded)

5 Perception of Gender Role Stereotype: The higher the score, the more progressive attitude towards gender role stereotype
6. Perception of Gender Equity : Higher score means higher perception or understanding of gender equity
7. Perception of Gender Equality for study \& research environment : Higher score means higher perception

## 2) Comparison with Other APNN Member Countries : Male response

|  |  | Average | Taiwan <br> $\sim$ Taiwan | $\begin{aligned} & 2.11 \\ & 2.64 \\ & \hline \end{aligned}$ | $\begin{aligned} & 0.687 \\ & 0.760 \\ & \hline \end{aligned}$ | -6.392 | 0.000 |

The questions are evaluated on a Likert-type scale ( 5 points).

1. Perception of Gender Barriers : Higher score means higher perception of gender barriers in STEM
2. Direct/Indirect Experience of Gender Barriers: Higher score means more experiences of gender barrier in STEM For the same questions, different answering set was provided to the respondents depending on their sex.
-Female respondent: 1. Never experienced, seen nor heard from others, 2. Neither seen nor heard but recognize the possibility, 3. Heard from others, 4. I have seen others experience, 5. Experienced for myself.
-Male respondent : 1. Never experienced, seen nor heard from others, 2. Neither seen nor heard but recognize the possibility, 3. Heard from others about unknown person's case, 4. Heard from my colleague or known person's experience, 5. I have seen someone experience
3. Career Outlook for Women in STEM : Higher score means more positive prospect (reverse coded)
4. Need for policy to overcome 'gender barriers' : Higher score means more agreement (reverse coded)

5 Perception of Gender Role Stereotype: The higher the score, the more progressive attitude towards gender role stereotype
6. Perception of Gender Equity : Higher score means higher perception or understanding of gender equity
7. Perception of Gender Equality for study \& research environment : Higher score means higher perception

## 2) Comparison with Other APNN Member Countries : Male response

|  | 7 | Female students in STEM are intimidated in the laboratory or in classes because they are female. | Mongolia ~Mongolia | $\begin{aligned} & 2.82 \\ & 3.74 \\ & \hline \end{aligned}$ | $\begin{aligned} & 0.946 \\ & 1.237 \\ & \hline \end{aligned}$ | 0.738 | 0.462 |
|  |  | Average | Mongolia <br> ~Mongolia | $\begin{aligned} & 2.53 \\ & 2.59 \\ & \hline \end{aligned}$ | $\begin{aligned} & 0.656 \\ & 0.784 \\ & \hline \end{aligned}$ | -0.669 | 0.505 |

The questions are evaluated on a Likert-type scale ( 5 points).

1. Perception of Gender Barriers : Higher score means higher perception of gender barriers in STEM
2. Direct/Indirect Experience of Gender Barriers : Higher score means more experiences of gender barrier in STEM

For the same questions, different answering set was provided to the respondents depending on their sex.
-Female respondent : 1. Never experienced, seen nor heard from others, 2. Neither seen nor heard but recognize the possibility, 3. Heard from others, 4. I have seen others experience, 5. Experienced for myself.
-Male respondent : 1. Never experienced, seen nor heard from others, 2. Neither seen nor heard but recognize the possibility, 3. Heard from others about unknown person's case, 4. Heard from my colleague or known person's experience, 5. I have seen someone experience
3. Career Outlook for Women in STEM : Higher score means more positive prospect (reverse coded)
4. Need for policy to overcome 'gender barriers' : Higher score means more agreement (reverse coded)

5 Perception of Gender Role Stereotype: The higher the score, the more progressive attitude towards gender role stereotype
6. Perception of Gender Equity : Higher score means higher perception or understanding of gender equity
7. Perception of Gender Equality for study \& research environment : Higher score means higher perception

## 2) Comparison with Other APNN Member Countries : Male response

<Table A1-11 Results from Male Respondents of Mongolia ( $\mathrm{n}=96$ ) compared with Average of APNN without Mongolia>

|  |  | Average | Bangladesh ~Bangladesh | $\begin{aligned} & \hline 2.69 \\ & 2.57 \\ & \hline \end{aligned}$ | $\begin{array}{r} 0.743 \\ 0.773 \\ \hline \end{array}$ | 0.991 | 0.322 |

The questions are evaluated on a Likert-type scale ( 5 points).

1. Perception of Gender Barriers : Higher score means higher perception of gender barriers in STEM
2. Direct/Indirect Experience of Gender Barriers : Higher score means more experiences of gender barrier in STEM For the same questions, different answering set was provided to the respondents depending on their sex.
-Female respondent : 1. Never experienced, seen nor heard from others, 2. Neither seen nor heard but recognize the possibility, 3. Heard from others, 4. I have seen others experience, 5. Experienced for myself.
-Male respondent : 1. Never experienced, seen nor heard from others, 2. Neither seen nor heard but recognize the possibility, 3. Heard from others about unknown person's case, 4. Heard from my colleague or known person's experience, 5. I have seen someone experience
3. Career Outlook for Women in STEM : Higher score means more positive prospect (reverse coded)
4. Need for policy to overcome 'gender barriers' : Higher score means more agreement (reverse coded)

5 Perception of Gender Role Stereotype: The higher the score, the more progressive attitude towards gender role stereotype
6. Perception of Gender Equity : Higher score means higher perception or understanding of gender equity
7. Perception of Gender Equality for study \& research environment : Higher score means higher perception

## 2) Comparison with Other APNN Member Countries : Male response

|  | 4 | Dealing with the funding donors (those providing funding for the project) in terms of administrative or budget process of the research project is equally fair regardless of the sex of the applicant | female <br> male | 2.55 2.45 | 1.062 1.159 | 0.480 | 0.632 |
|  | 5 | Women receive the same social evaluation and respect to men as scientists or engineers (by their colleagues, professor, funding donors, academic association, scientific society etc) | female male | 3.13 2.38 | $\begin{aligned} & 1.265 \\ & 1.225 \end{aligned}$ | 3.025 | 0.003 |
|  | 6 | Marriage, pregnancy or child care have the same effect on scientists/engineers regardless of their sex for their study, research or project performance. | female male | 2.94 2.66 | $\begin{aligned} & 1.360 \\ & 1.352 \end{aligned}$ | 1.048 | 0.297 |
|  | 7 | Female students in STEM are intimidated in the laboratory or in classes because they are female. | female male | $\begin{aligned} & 3.20 \\ & 3.07 \end{aligned}$ | $\begin{aligned} & 1.172 \\ & 1.126 \end{aligned}$ | 0.591 | 0.556 |
|  |  | Average | female <br> male | $\begin{aligned} & 2.69 \\ & 2.38 \\ & \hline \end{aligned}$ | $\begin{aligned} & 0.743 \\ & 0.751 \\ & \hline \end{aligned}$ | 2.082 | 0.040 |

The questions are evaluated on a Likert-type scale ( 5 points).

1. Perception of Gender Barriers : Higher score means higher perception of gender barriers in STEM
2. Direct/Indirect Experience of Gender Barriers : Higher score means more experiences of gender barrier in STEM For the same questions, different answering set was provided to the respondents depending on their sex.
-Female respondent : 1. Never experienced, seen nor heard from others, 2. Neither seen nor heard but recognize the possibility, 3. Heard from others, 4. I have seen others experience, 5. Experienced for myself.
-Male respondent : 1. Never experienced, seen nor heard from others, 2. Neither seen nor heard but recognize the possibility, 3. Heard from others about unknown person's case, 4. Heard from my colleague or known person's experience, 5. I have seen someone experience
3. Career Outlook for Women in STEM : Higher score means more positive prospect (reverse coded)
4. Need for policy to overcome 'gender barriers' : Higher score means more agreement (reverse coded)

5 Perception of Gender Role Stereotype: The higher the score, the more progressive attitude towards gender role stereotype
6. Perception of Gender Equity : Higher score means higher perception or understanding of gender equity
7. Perception of Gender Equality for study \& research environment : Higher score means higher perception

## A1.6 Vietnam

## 1) Comparison with Other APNN Member Countries : Female Response

<Table A1-16 Results from Female Respondents of Vietnam ( $\mathrm{n}=109$ ) compared with Average of APNN without Vietnam>

| Classifications |  | Question | Country | average | standard <br> deviation | t | (p) |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 1. <br> Perception <br> of Gender Barriers | 1 | Girls and boys are equally encouraged to choose their majors in STEM during their education period. | Vietnam <br> ~Vietnam | $\begin{aligned} & 3.47 \\ & 2.31 \end{aligned}$ | $\begin{aligned} & 0.675 \\ & 1.248 \end{aligned}$ | 14.536 | 0.000 |
|  | 2 | Female students in STEM receive equally fair assessments and appraisal compared to their male counterparts of the same qualifications and level for their work, task or project results. | Vietnam <br> ~Vietnam | 2.87 2.45 | $\begin{aligned} & 0.640 \\ & 1.247 \end{aligned}$ | 5.427 | 0.000 |

|  | 4 | Dealing with the funding donors (those providing funding for the project) in terms of administrative or budget process of the research project is equally fair regardless of the sex of the applicant | Vietnam <br> ~Vietnam | $\begin{aligned} & 2.48 \\ & 2.08 \end{aligned}$ | $\begin{aligned} & 0.759 \\ & 1.053 \end{aligned}$ | 4.989 | 0.000 |
|  | 5 | Women receive the same social evaluation and respect to men as scientists or engineers (by their colleagues, professor, funding donors, academic association, scientific society etc) | Vietnam <br> ~Vietnam | $\begin{aligned} & 3.19 \\ & 2.03 \end{aligned}$ | $\begin{aligned} & 0.787 \\ & 1.049 \end{aligned}$ | 13.890 | 0.000 |
|  | 6 | Marriage, pregnancy or child care have the same effect on scientists/engineers regardless of their sex for their study, research or project performance. | Vietnam <br> ~Vietnam | 2.70 2.57 | 0.799 1.279 | 1.443 | 0.150 |
|  | 7 | Female students in STEM are intimidated in the laboratory or in classes because they are female. | Vietnam <br> ~Vietnam | $\begin{aligned} & \hline 3.06 \\ & 2.74 \end{aligned}$ | $\begin{aligned} & \hline 0.936 \\ & 1.261 \end{aligned}$ | 3.227 | 0.001 |
|  |  | Average | Vietnam <br> ~Vietnam | $\begin{aligned} & 2.88 \\ & 2.17 \\ & \hline \end{aligned}$ | $\begin{aligned} & 0.402 \\ & 0.710 \\ & \hline \end{aligned}$ | 15.340 | 0.000 |

The questions are evaluated on a Likert-type scale (5 points).

1. Perception of Gender Barriers : Higher score means higher perception of gender barriers in STEM
2. Direct/Indirect Experience of Gender Barriers : Higher score means more experiences of gender barrier in STEM For the same questions, different answering set was provided to the respondents depending on their sex. -Female respondent : 1. Never experienced, seen nor heard from others, 2. Neither seen nor heard but recognize the possibility, 3. Heard from others, 4. I have seen others experience, 5. Experienced for myself.
-Male respondent : 1. Never experienced, seen nor heard from others, 2. Neither seen nor heard but recognize the possibility, 3. Heard from others about unknown person's case, 4. Heard from my colleague or known person's experience, 5. I have seen someone experience
3. Career Outlook for Women in STEM : Higher score means more positive prospect (reverse coded)
4. Need for policy to overcome 'gender barriers' : Higher score means more agreement (reverse coded)

5 Perception of Gender Role Stereotype: The higher the score, the more progressive attitude towards gender role stereotype
6. Perception of Gender Equity : Higher score means higher perception or understanding of gender equity
7. Perception of Gender Equality for study \& research environment : Higher score means higher perception

## 3) Comparison of results between Female and Male respondents ( $\mathrm{n}=227$ )

<Table A1-18 Comparative Results between Female and Male Respondents of Vietnam (109 female, 118 male persons)>

|  |  |  |  |  |  |  | Poin |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Classifications |  | Question | Country | average | standard deviation | t | (p) |
| 1. <br> Perception of Gender Barriers | 1 | Girls and boys are equally encouraged to choose their majors in STEM during their education period. |  | 3.47 | 0.675 | 7.100 | 0.000 |
|  |  |  | male | 2.75 | 0.837 |  |  |
|  | 2 | Female students in STEM receive equally fair assessments and appraisal compared to their male counterparts of the same qualifications and level for their work, task or project results. | female <br> male | 2.87 2.80 | $\begin{aligned} & 0.640 \\ & 0.843 \end{aligned}$ | 0.758 | 0.449 |
|  | 3 | Women in STEM receive equal work distribution and work appraisal compared to men of the same qualifications and level. | female <br> male | $\begin{aligned} & 3.77 \\ & 3.10 \\ & \hline \end{aligned}$ | $\begin{aligned} & 0.647 \\ & 0.885 \end{aligned}$ | 6.509 | 0.000 |
|  | 4 | It is equally difficult for a woman to get a job in the STEM field than for a man with the same qualifications. | female <br> male | $\begin{aligned} & 2.97 \\ & 2.91 \end{aligned}$ | $\begin{aligned} & 0.967 \\ & 0.773 \end{aligned}$ | 0.563 | 0.574 |

The questions are evaluated on a Likert-type scale (5 points).

1. Perception of Gender Barriers : Higher score means higher perception of gender barriers in STEM
2. Direct/Indirect Experience of Gender Barriers : Higher score means more experiences of gender barrier in STEM

For the same questions, different answering set was provided to the respondents depending on their sex.
-Female respondent : 1. Never experienced, seen nor heard from others, 2. Neither seen nor heard but recognize the possibility, 3. Heard from others, 4. I have seen others experience, 5. Experienced for myself.
-Male respondent : 1. Never experienced, seen nor heard from others, 2. Neither seen nor heard but recognize the possibility, 3. Heard from others about unknown person's case, 4. Heard from my colleague or known person's experience, 5. I have seen someone experience
3. Career Outlook for Women in STEM : Higher score means more positive prospect (reverse coded)
4. Need for policy to overcome 'gender barriers' : Higher score means more agreement (reverse coded)

5 Perception of Gender Role Stereotype: The higher the score, the more progressive attitude towards gender role stereotype
6. Perception of Gender Equity : Higher score means higher perception or understanding of gender equity
7. Perception of Gender Equality for study \& research environment : Higher score means higher perception

## 2) Comparison with Other APNN Member Countries : Male response

|  | 4 | Dealing with the funding donors (those providing funding for the project) in terms of administrative or budget process of the research project is equally fair regardless of the sex of the applicant | Sri Lanka <br> $\sim$ Sri Lanka | 1.70 2.15 | 0.949 1.023 | -1.371 | 0.171 |
|  | 5 | Women receive the same social evaluation and respect to men as scientists or engineers (by their colleagues, professor, funding donors, academic association, scientific society etc) | Sri Lanka $\sim$ Sri Lanka | 2.40 2.21 | 1.430 1.092 | 0.411 | 0.691 |
|  | 6 | Marriage, pregnancy or child care have the same effect on scientists/engineers regardless of their sex for their study, research or project performance. | Sri Lanka ~Sri Lanka | $\begin{aligned} & 2.10 \\ & 2.60 \end{aligned}$ | $\begin{aligned} & 1.197 \\ & 1.216 \end{aligned}$ | -1.295 | 0.196 |
|  | 7 | Female students in STEM are intimidated in the laboratory or in classes because they are female. | Sri Lanka -Sii Lanka | $\begin{aligned} & 1.44 \\ & 2.80 \end{aligned}$ | $\begin{aligned} & 1.014 \\ & 1.215 \end{aligned}$ | -3.344 | 0.001 |
|  |  | Average | Sri Lanka -Sii Lanka | $\begin{aligned} & 1.76 \\ & 2.28 \\ & \hline \end{aligned}$ | $\begin{aligned} & 0.800 \\ & 0.716 \end{aligned}$ | -2.291 | 0.022 |

The questions are evaluated on a Likert-type scale (5 points).

1. Perception of Gender Barriers : Higher score means higher perception of gender barriers in STEM
2. Direct/Indirect Experience of Gender Barriers : Higher score means more experiences of gender barrier in STEM

For the same questions, different answering set was provided to the respondents depending on their sex.
-Female respondent : 1. Never experienced, seen nor heard from others, 2. Neither seen nor heard but recognize the possibility, 3. Heard from others, 4. I have seen others experience, 5. Experienced for myself.
-Male respondent : 1. Never experienced, seen nor heard from others, 2. Neither seen nor heard but recognize the possibility, 3. Heard from others about unknown person's case, 4. Heard from my colleague or known person's experience, 5. I have seen someone experience
3. Career Outlook for Women in STEM : Higher score means more positive prospect (reverse coded)
4. Need for policy to overcome 'gender barriers' : Higher score means more agreement (reverse coded)

5 Perception of Gender Role Stereotype: The higher the score, the more progressive attitude towards gender role stereotype
6. Perception of Gender Equity : Higher score means higher perception or understanding of gender equity
7. Perception of Gender Equality for study \& research environment : Higher score means higher perception

## 3) Comparison of results between Female and Male respondents ( $\mathrm{n}=46$ )

<Table A1-21 Comparative Results between Female and Male Respondents of Sri Lanka (35 female, 11 male persons)>

<Table A1-21 Comparative Results between Female and Male Respondents of Sri Lanka ( 35 female, 11 male persons)>

The questions are evaluated on a Likert-type scale (5 points).

1. Perception of Gender Barriers : Higher score means higher perception of gender barriers in STEM
2. Direct/Indirect Experience of Gender Barriers : Higher score means more experiences of gender barrier in STEM

For the same questions, different answering set was provided to the respondents depending on their sex.
-Female respondent : 1. Never experienced, seen nor heard from others, 2. Neither seen nor heard but recognize the possibility, 3. Heard from others, 4. I have seen others experience, 5. Experienced for myself.
-Male respondent : 1. Never experienced, seen nor heard from others, 2. Neither seen nor heard but recognize the possibility, 3. Heard from others about unknown person's case, 4. Heard from my colleague or known person's experience, 5. I have seen someone experience
3. Career Outlook for Women in STEM : Higher score means more positive prospect (reverse coded)
4. Need for policy to overcome 'gender barriers' : Higher score means more agreement (reverse coded)

5 Perception of Gender Role Stereotype: The higher the score, the more progressive attitude towards gender role stereotype
6. Perception of Gender Equity : Higher score means higher perception or understanding of gender equity
7. Perception of Gender Equality for study \& research environment : Higher score means higher perception

## A1.8 Japan

## 1) Comparison with Other APNN Member Countries : Female Response

<Table A1-22 Results from Female Respondents of Japan ( $\mathrm{n}=113$ ) compared with Average of APNN without Japan>

| Classifications |  | Question | Country | average | standard deviation | t | (p) |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |

|  | 5 | Women receive the same social evaluation and respect to men as scientists or engineers (by their colleagues, professor, funding donors, academic association, scientific society etc) | Japan <br> $\sim$ Japan | $\begin{aligned} & 1.72 \\ & 2.26 \end{aligned}$ | $\begin{aligned} & 0.934 \\ & 1.099 \end{aligned}$ | -4.508 | 0.000 |
|  | 6 | Marriage, pregnancy or child care have the same effect on scientists/engineers regardless of their sex for their study, research or project performance. | $\begin{aligned} & \text { Japan } \\ & \sim \text { Japan } \end{aligned}$ | $\begin{aligned} & 1.91 \\ & 2.66 \end{aligned}$ | $\begin{aligned} & 0.949 \\ & 1.220 \end{aligned}$ | -6.010 | 0.000 |
|  | 7 | Female students in STEM are intimidated in the laboratory or in classes because they are female. | Japan <br> $\sim$ Japan | $\begin{aligned} & 2.30 \\ & 2.86 \end{aligned}$ | $\begin{aligned} & 1.218 \\ & 1.197 \end{aligned}$ | -5.424 | 0.000 |
|  |  | Average | Japan ~Japan | $\begin{aligned} & 1.87 \\ & 2.32 \end{aligned}$ | $\begin{aligned} & 0.666 \\ & 0.712 \end{aligned}$ | -4.954 | 0.000 |

The questions are evaluated on a Likert-type scale (5 points).

1. Perception of Gender Barriers : Higher score means higher perception of gender barriers in STEM
2. Direct/Indirect Experience of Gender Barriers : Higher score means more experiences of gender barrier in STEM

For the same questions, different answering set was provided to the respondents depending on their sex.
-Female respondent : 1. Never experienced, seen nor heard from others, 2. Neither seen nor heard but recognize the possibility, 3. Heard from others, 4. I have seen others experience, 5. Experienced for myself.
-Male respondent : 1. Never experienced, seen nor heard from others, 2. Neither seen nor heard but recognize the possibility, 3. Heard from others about unknown person's case, 4. Heard from my colleague or known person's experience, 5. I have seen someone experience
3. Career Outlook for Women in STEM : Higher score means more positive prospect (reverse coded)
4. Need for policy to overcome 'gender barriers' : Higher score means more agreement (reverse coded)

5 Perception of Gender Role Stereotype: The higher the score, the more progressive attitude towards gender role stereotype
6. Perception of Gender Equity : Higher score means higher perception or understanding of gender equity
7. Perception of Gender Equality for study \& research environment: Higher score means higher perception

## 3) Comparison of results between Female and Male respondents ( $\mathrm{n}=180$ )

|  | 3 | The strictness, objectiveness and importance of the research outcome are equally respected regardless of the sex of the person in charge | Pakistan <br> $\sim$ Pakistan | $\begin{aligned} & 2.34 \\ & 2.25 \\ & \hline \end{aligned}$ | $\begin{aligned} & 1.183 \\ & 1.002 \end{aligned}$ | 0.747 | 0.456 |
|  | 4 | Dealing with the funding donors (those providing funding for the project) in terms of administrative or budget process of the research project is equally fair regardless of the sex of the applicant | Pakistan <br> $\sim$ Pakistan | 2.65 2.42 | $\begin{aligned} & 1.077 \\ & 1.033 \end{aligned}$ | 2.097 | 0.036 |
|  | 5 | Women receive the same social evaluation and respect to men as scientists or engineers (by their colleagues, professor, funding donors, academic association, scientific society etc) | Pakistan <br> $\sim$ Pakistan | $\begin{aligned} & 2.92 \\ & 2.65 \end{aligned}$ | $\begin{aligned} & 1.308 \\ & 1.135 \end{aligned}$ | 1.991 | 0.049 |
|  | 6 | Marriage, pregnancy or child care have the same effect on scientists/engineers regardless of their sex for their study, research or project performance. | Pakistan <br> ~Pakistan | $\begin{aligned} & 3.50 \\ & 3.04 \\ & \hline \end{aligned}$ | $\begin{aligned} & 1.360 \\ & 1.382 \end{aligned}$ | 3.085 | 0.002 |
|  | 7 | Female students in STEM are intimidated in the laboratory or in classes because they are female. | Pakistan <br> ~Pakistan | $\begin{aligned} & 3.30 \\ & 2.67 \\ & \hline \end{aligned}$ | $\begin{aligned} & 1.168 \\ & 1.194 \\ & \hline \end{aligned}$ | 4.977 | 0.000 |
|  |  | Average | Pakistan <br> ~Pakistan | $\begin{aligned} & 2.79 \\ & 2.55 \\ & \hline \end{aligned}$ | $\begin{aligned} & \hline 0.827 \\ & 0.758 \\ & \hline \end{aligned}$ | 2.857 | 0.004 |

The questions are evaluated on a Likert-type scale ( 5 points).

1. Perception of Gender Barriers : Higher score means higher perception of gender barriers in STEM
2. Direct/Indirect Experience of Gender Barriers : Higher score means more experiences of gender barrier in STEM For the same questions, different answering set was provided to the respondents depending on their sex.
-Female respondent : 1. Never experienced, seen nor heard from others, 2. Neither seen nor heard but recognize the possibility, 3. Heard from others, 4. I have seen others experience, 5. Experienced for myself.
-Male respondent : 1. Never experienced, seen nor heard from others, 2. Neither seen nor heard but recognize the possibility, 3. Heard from others about unknown person's case, 4. Heard from my colleague or known person's experience, 5. I have seen someone experience
3. Career Outlook for Women in STEM : Higher score means more positive prospect (reverse coded)
4. Need for policy to overcome 'gender barriers' : Higher score means more agreement (reverse coded)

5 Perception of Gender Role Stereotype: The higher the score, the more progressive attitude towards gender role stereotype
6. Perception of Gender Equity : Higher score means higher perception or understanding of gender equity
7. Perception of Gender Equality for study \& research environment : Higher score means higher perception

## 2) Comparison with Other APNN Member Countries : Male response

The questions are evaluated on a Likert-type scale ( 5 points).

1. Perception of Gender Barriers : Higher score means higher perception of gender barriers in STEM
2. Direct/Indirect Experience of Gender Barriers : Higher score means more experiences of gender barrier in STEM

For the same questions, different answering set was provided to the respondents depending on their sex.
-Female respondent : 1. Never experienced, seen nor heard from others, 2. Neither seen nor heard but recognize the possibility, 3. Heard from others, 4. I have seen others experience, 5. Experienced for myself.
-Male respondent : 1. Never experienced, seen nor heard from others, 2. Neither seen nor heard but recognize the possibility, 3. Heard from others about unknown person's case, 4. Heard from my colleague or known person's experience, 5. I have seen someone experience
3. Career Outlook for Women in STEM : Higher score means more positive prospect (reverse coded)
4. Need for policy to overcome 'gender barriers' : Higher score means more agreement (reverse coded)

5 Perception of Gender Role Stereotype: The higher the score, the more progressive attitude towards gender role stereotype
6. Perception of Gender Equity : Higher score means higher perception or understanding of gender equity
7. Perception of Gender Equality for study \& research environment : Higher score means higher perception

## 3) Comparison of results between Female and Male respondents ( $\mathrm{n}=199$ )

<Table A1-27 Comparative Results between Female and Male Respondents of Pakistan ( 100 female, 99 male persons) $>$

<Table A1-27 Comparative Results between Female and Male Respondents of Pakistan (100 female, 99 male persons)>

The questions are evaluated on a Likert-type scale (5 points).

1. Perception of Gender Barriers : Higher score means higher perception of gender barriers in STEM
2. Direct/Indirect Experience of Gender Barriers : Higher score means more experiences of gender barrier in STEM For the same questions, different answering set was provided to the respondents depending on their sex.
-Female respondent : 1. Never experienced, seen nor heard from others, 2. Neither seen nor heard but recognize the possibility, 3. Heard from others, 4. I have seen others experience, 5. Experienced for myself.
-Male respondent : 1. Never experienced, seen nor heard from others, 2. Neither seen nor heard but recognize the possibility, 3. Heard from others about unknown person's case, 4. Heard from my colleague or known person's experience, 5. I have seen someone experience
3. Career Outlook for Women in STEM : Higher score means more positive prospect (reverse coded)
4. Need for policy to overcome 'gender barriers' : Higher score means more agreement (reverse coded)

5 Perception of Gender Role Stereotype: The higher the score, the more progressive attitude towards gender role stereotype
6. Perception of Gender Equity : Higher score means higher perception or understanding of gender equity
7. Perception of Gender Equality for study \& research environment : Higher score means higher perception

## A1.10 South Korea

## 1) Comparison with Other APNN Member Countries : Female Response

<Table A1-28 Results from Female Respondents of South Korea ( $\mathrm{n}=99$ ) compared with Average of APNN without South Korea>

| Classifications |  | Question | Country | average | standard <br> deviation | t | (p) |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 1. <br> Perception <br> of Gender <br> Barriers | 1 | Girls and boys are equally encouraged to choose their majors in STEM during their education period. | S Korea ~S Korea | $\begin{aligned} & 2.53 \\ & 2.45 \end{aligned}$ | $\begin{aligned} & 1.091 \\ & 1.273 \end{aligned}$ | 0.605 | 0.546 |

The questions are evaluated on a Likert-type scale (5 points).

1. Perception of Gender Barriers : Higher score means higher perception of gender barriers in STEM
2. Direct/Indirect Experience of Gender Barriers : Higher score means more experiences of gender barrier in STEM

For the same questions, different answering set was provided to the respondents depending on their sex.
-Female respondent : 1. Never experienced, seen nor heard from others, 2. Neither seen nor heard but recognize the possibility, 3. Heard from others, 4. I have seen others experience, 5. Experienced for myself.
-Male respondent : 1. Never experienced, seen nor heard from others, 2. Neither seen nor heard but recognize the possibility, 3. Heard from others about unknown person's case, 4. Heard from my colleague or known person's experience, 5. I have seen someone experience
3. Career Outlook for Women in STEM : Higher score means more positive prospect (reverse coded)
4. Need for policy to overcome 'gender barriers' : Higher score means more agreement (reverse coded)

5 Perception of Gender Role Stereotype: The higher the score, the more progressive attitude towards gender role stereotype
6. Perception of Gender Equity : Higher score means higher perception or understanding of gender equity
7. Perception of Gender Equality for study \& research environment : Higher score means higher perception

## 3) Comparison of results between Female and Male respondents ( $\mathrm{n}=219$ )

$<$ Table A1-30 Comparative Results between Female and Male Respondents of South Korea (99 female, 120 male persons)>

| Classifications |  | Question | Country | average | standard deviation | t | (p) |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 1. <br> Perception of Gender Barriers | 1 | Girls and boys are equally encouraged to choose their majors in STEM during their education period. | female | 2.53 | 1.091 | 0.860 | 0.391 |
|  |  |  | male | 2.41 | 0.921 |  |  |
|  | 2 | Female students in STEM receive equally fair assessments and appraisal compared to their male counterparts of the same qualifications and level for their work, task or project results. | female | 2.44 | 1.090 | 1.235 | 0.218 |
|  |  |  | male | 2.27 | 1.035 |  |  |

The questions are evaluated on a Likert-type scale (5 points).

1. Perception of Gender Barriers : Higher score means higher perception of gender barriers in STEM
2. Direct/Indirect Experience of Gender Barriers : Higher score means more experiences of gender barrier in STEM For the same questions, different answering set was provided to the respondents depending on their sex. -Female respondent : 1. Never experienced, seen nor heard from others, 2. Neither seen nor heard but recognize the possibility, 3. Heard from others, 4. I have seen others experience, 5. Experienced for myself.
-Male respondent : 1. Never experienced, seen nor heard from others, 2. Neither seen nor heard but recognize the possibility, 3. Heard from others about unknown person's case, 4. Heard from my colleague or known person's experience, 5. I have seen someone experience
3. Career Outlook for Women in STEM : Higher score means more positive prospect (reverse coded)
4. Need for policy to overcome 'gender barriers' : Higher score means more agreement (reverse coded)

5 Perception of Gender Role Stereotype: The higher the score, the more progressive attitude towards gender role stereotype
6. Perception of Gender Equity : Higher score means higher perception or understanding of gender equity
7. Perception of Gender Equality for study \& research environment : Higher score means higher perception

## Appendix 2. Survey Results by Participating Country (ARN)

Individual country results of the 3 ARN countries are shown herein in table format. The three tables for each country are: 1) Results of female responses of the country in comparison with ARN female average (which excludes the particular country). For example, for Nigeria, the average score from female respondents are compared with those from ARN countries excluding those from Nigeria; 2) Results of male responses of the country in comparison with ARN average (which excludes the particular country). For example, for Nigeria, the average score from male respondents are compared with those of ARN countries excluding those from Nigeria; 3) Comparison of results from female and male respondents of the country. For example for each question results from female respondents of Nigeria is compared with those from male respondents of Nigeria. A $p$ value of less than 0.05 indicates a statistically significant difference.

## A2.1 Nigeria

1) Comparison with Other ARN Member Countries : Female Response
<Table A2-1 Results from Female Respondents of Nigeria ( $\mathrm{n}=133$ ) compared with Average of ARN without Nigeria>

<Table A2-1 Results from Female Respondents of Nigeria ( $\mathrm{n}=133$ ) compared with Average of ARN without Nigeria>

|  | 5 | Women receive the same social evaluation and respect to men as scientists or engineers (by their colleagues, professor, funding donors, academic association, scientific society etc) | Nigeria $\sim$ Nigeria | $\begin{aligned} & 4.24 \\ & 3.03 \\ & \hline \end{aligned}$ | 0.872 1.509 | 6.037 | 0.000 |

<Table A2-1 Results from Female Respondents of Nigeria ( $\mathrm{n}=133$ ) compared with Average of ARN without Nigeria>

The questions are evaluated on a Likert-type scale (5 points).

1. Perception of Gender Barriers : Higher score means higher perception of gender barriers in STEM
2. Direct/Indirect Experience of Gender Barriers : Higher score means more experiences of gender barrier in STEM For the same questions, different answering set was provided to the respondents depending on their sex.
-Female respondent : 1. Never experienced, seen nor heard from others, 2. Neither seen nor heard but recognize the possibility, 3. Heard from others, 4. I have seen others experience, 5. Experienced for myself.
-Male respondent : 1. Never experienced, seen nor heard from others, 2. Neither seen nor heard but recognize the possibility, 3. Heard from others about unknown person's case, 4. Heard from my colleague or known person's experience, 5. I have seen someone experience
3. Career Outlook for Women in STEM : Higher score means more positive prospect (reverse coded)
4. Need for policy to overcome 'gender barriers' : Higher score means more agreement (reverse coded)

5 Perception of Gender Role Stereotype: The higher the score, the more progressive attitude towards gender role stereotype
6. Perception of Gender Equity : Higher score means higher perception or understanding of gender equity
7. Perception of Gender Equality for study \& research environment : Higher score means higher perception

## 2) Comparison with Other ARN Member Countries : Male Response

<Table A2-2 Results from Male Respondents of Nigeria ( $\mathrm{n}=212$ ) compared with Average of ARN without Nigeria>

|  | 4 | Dealing with the funding donors (those providing funding for the project) in terms of administrative or budget process of the research project is equally fair regardless of the sex of the applicant | Uganda <br> $\sim$ Uganda | 2.23 1.75 | $\begin{aligned} & 1.306 \\ & 0.959 \end{aligned}$ | 1.800 | 0.082 |
|  | 5 | Women receive the same social evaluation and respect to men as scientists or engineers (by their colleagues, professor, funding donors, academic association, scientific society etc) | Uganda <br> $\sim$ Uganda | 2.58 4.03 | $\begin{aligned} & 1.447 \\ & 1.112 \end{aligned}$ | -4.903 | 0.000 |
|  | 6 | Marriage, pregnancy or child care have the same effect on scientists/engineers regardless of their sex for their study, research or project performance. | Uganda <br> $\sim$ Uganda | $\begin{aligned} & 3.38 \\ & 3.63 \end{aligned}$ | $\begin{aligned} & 1.651 \\ & 1.411 \end{aligned}$ | -0.720 | 0.477 |
|  | 7 | Female students in STEM are intimidated in the laboratory or in classes because they are female. | Uganda $\sim$ Uganda | $\begin{aligned} & 3.15 \\ & 3.73 \\ & \hline \end{aligned}$ | $\begin{aligned} & 1.156 \\ & 1.104 \end{aligned}$ | -2.483 | 0.014 |
|  |  | Average | Uganda ~Uganda | $\begin{aligned} & \hline 2.40 \\ & 2.85 \\ & \hline \end{aligned}$ | $\begin{aligned} & 0.715 \\ & 0.589 \\ & \hline \end{aligned}$ | -3.492 | 0.001 |

The questions are evaluated on a Likert-type scale (5 points).

1. Perception of Gender Barriers : Higher score means higher perception of gender barriers in STEM
2. Direct/Indirect Experience of Gender Barriers : Higher score means more experiences of gender barrier in STEM For the same questions, different answering set was provided to the respondents depending on their sex.
-Female respondent: 1. Never experienced, seen nor heard from others, 2. Neither seen nor heard but recognize the possibility, 3. Heard from others, 4. I have seen others experience, 5. Experienced for myself.
-Male respondent : 1. Never experienced, seen nor heard from others, 2. Neither seen nor heard but recognize the possibility, 3. Heard from others about unknown person's case, 4. Heard from my colleague or known person's experience, 5. I have seen someone experience
3. Career Outlook for Women in STEM : Higher score means more positive prospect (reverse coded)
4. Need for policy to overcome 'gender barriers' : Higher score means more agreement (reverse coded)

5 Perception of Gender Role Stereotype: The higher the score, the more progressive attitude towards gender role stereotype
6. Perception of Gender Equity : Higher score means higher perception or understanding of gender equity
7. Perception of Gender Equality for study \& research environment : Higher score means higher perception

## 2) Comparison with Other ARN Member Countries : Male Response

<Table A2-5 Results from Male Respondents of Uganda ( $\mathrm{n}=53$ ) compared with Average of ARN without Uganda>

| (Unit: Point) |  |  |  |  |  |  |  |

The questions are evaluated on a Likert-type scale (5 points).

1. Perception of Gender Barriers : Higher score means higher perception of gender barriers in STEM
2. Direct/Indirect Experience of Gender Barriers : Higher score means more experiences of gender barrier in STEM For the same questions, different answering set was provided to the respondents depending on their sex.
-Female respondent : 1. Never experienced, seen nor heard from others, 2. Neither seen nor heard but recognize the possibility, 3. Heard from others, 4. I have seen others experience, 5. Experienced for myself.
-Male respondent : 1. Never experienced, seen nor heard from others, 2. Neither seen nor heard but recognize the possibility, 3. Heard from others about unknown person's case, 4. Heard from my colleague or known person's experience, 5. I have seen someone experience
3. Career Outlook for Women in STEM : Higher score means more positive prospect (reverse coded)
4. Need for policy to overcome 'gender barriers' : Higher score means more agreement (reverse coded)

5 Perception of Gender Role Stereotype: The higher the score, the more progressive attitude towards gender role stereotype
6. Perception of Gender Equity : Higher score means higher perception or understanding of gender equity
7. Perception of Gender Equality for study \& research environment : Higher score means higher perception

## A2.3 Kenya

## 1) Comparison with Other ARN Member Countries : Female Response

<Table A2-7 Results from Female Respondents of Kenya ( $\mathrm{n}=40$ ) compared with Average of ARN without Kenya>

| Classifications |  | Question | Country | average | standard <br> deviation | t | (p) |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 1. <br> Perception <br> of Gender Barriers | 1 | Girls and boys are equally encouraged to choose their majors in STEM during their education period. | Kenya <br> -Kenya | $\begin{aligned} & 2.48 \\ & 2.36 \end{aligned}$ | $\begin{aligned} & 1.467 \\ & 1.304 \end{aligned}$ | 0.492 | 0.623 |
|  | 2 | Female students in STEM receive equally fair assessments and appraisal compared to their male counterparts of the same qualifications and level for their work, task or project results. | Kenya <br> $\sim$ Kenya | $\begin{aligned} & 2.80 \\ & 2.05 \end{aligned}$ | $\begin{aligned} & 1.454 \\ & 1.005 \end{aligned}$ | 3.082 | 0.003 |
|  | 3 | Women in STEM receive equal work distribution and work appraisal compared to men of the same qualifications and level. | Kenya <br> $\sim$ Kenya | $\begin{aligned} & 3.10 \\ & 2.97 \end{aligned}$ | $\begin{aligned} & 1.355 \\ & 1.480 \end{aligned}$ | 0.486 | 0.627 |
|  | 4 | It is equally difficult for a woman to get a job in the STEM field than for a man with the same qualifications. | Kenya <br> ~Kenya | $\begin{aligned} & 2.40 \\ & 2.53 \end{aligned}$ | $\begin{aligned} & 1.297 \\ & 1.453 \end{aligned}$ | -0.535 | 0.594 |
|  | 5 | Being promoted or becoming a tenured professor or a principal investigator is equally difficult for female scientists than for male. | Kenya <br> $\sim$ Kenya | $\begin{aligned} & 2.60 \\ & 1.88 \end{aligned}$ | $\begin{aligned} & 1.317 \\ & 0.830 \end{aligned}$ | 3.296 | 0.002 |
|  | 6 | Women in STEM generally receive equal pay for equal work, compared with their equally-qualified male colleagues. | Kenya <br> ~Kenya | $\begin{aligned} & 2.70 \\ & 1.68 \end{aligned}$ | $\begin{aligned} & 1.556 \\ & 0.806 \end{aligned}$ | 4.016 | 0.000 |

|  | 4 | Dealing with the funding donors (those providing funding for the project) in terms of administrative or budget process of the research project is equally fair regardless of the sex of the applicant | Kenya <br> ~Kenya | 2.38 1.67 | 1.353 0.868 | 3.124 | 0.003 |
|  | 5 | Women receive the same social evaluation and respect to men as scientists or engineers (by their colleagues, professor, funding donors, academic association, scientific society etc) | Kenya <br> ~Kenya | 3.33 3.97 | 1.492 1.161 | -2.542 | 0.014 |
|  | 6 | Marriage, pregnancy or child care have the same effect on scientists/engineers regardless of their sex for their study, research or project performance. | Kenya <br> ~Kenya | $\begin{aligned} & 3.08 \\ & 3.73 \end{aligned}$ | $\begin{aligned} & 1.685 \\ & 1.349 \end{aligned}$ | -2.280 | 0.027 |
|  | 7 | Female students in STEM are intimidated in the laboratory or in classes because they are female. | Kenya <br> ~Kenya | $\begin{aligned} & 2.95 \\ & 3.84 \\ & \hline \end{aligned}$ | $\begin{aligned} & 1.467 \\ & 0.947 \end{aligned}$ | -3.637 | 0.001 |
|  |  | Average | Kenya <br> ~Kenya | $\begin{aligned} & \hline 2.72 \\ & 2.81 \\ & \hline \end{aligned}$ | $\begin{aligned} & 0.966 \\ & 0.505 \end{aligned}$ | -0.533 | 0.597 |

The questions are evaluated on a Likert-type scale (5 points).

1. Perception of Gender Barriers : Higher score means higher perception of gender barriers in STEM
2. Direct/Indirect Experience of Gender Barriers : Higher score means more experiences of gender barrier in STEM For the same questions, different answering set was provided to the respondents depending on their sex.
-Female respondent : 1. Never experienced, seen nor heard from others, 2. Neither seen nor heard but recognize the possibility, 3. Heard from others, 4. I have seen others experience, 5. Experienced for myself.
-Male respondent : 1. Never experienced, seen nor heard from others, 2. Neither seen nor heard but recognize the possibility, 3. Heard from others about unknown person's case, 4. Heard from my colleague or known person's experience, 5. I have seen someone experience
3. Career Outlook for Women in STEM : Higher score means more positive prospect (reverse coded)
4. Need for policy to overcome 'gender barriers' : Higher score means more agreement (reverse coded)

5 Perception of Gender Role Stereotype: The higher the score, the more progressive attitude towards gender role stereotype
6. Perception of Gender Equity : Higher score means higher perception or understanding of gender equity
7. Perception of Gender Equality for study \& research environment : Higher score means higher perception

## 2) Comparison with Other ARN Member Countries : Male Response

|  | 4 | In order to maintain the order and peace of a family, the husband should have a greater power and authority than the wife. | female <br> male | $\begin{aligned} & 3.23 \\ & 2.38 \end{aligned}$ | $\begin{aligned} & 1.747 \\ & 1.267 \end{aligned}$ | 2.262 | 0.027 |
|  |  | Average | female male | $\begin{aligned} & \hline 3.13 \\ & 2.41 \\ & \hline \end{aligned}$ | $\begin{aligned} & 1.298 \\ & 0.941 \\ & \hline \end{aligned}$ | 2.578 | 0.012 |
| 6. <br> Perception of Gender Equity | 1 | I believe gender equality will be fully achieved only if women are given equal opportunities as men. | female <br> male | $\begin{aligned} & 1.40 \\ & 1.81 \end{aligned}$ | $\begin{aligned} & 0.672 \\ & 1.021 \end{aligned}$ | -1.960 | 0.054 |
| 7. <br> Perception of Gender Equality for study and research Environment | 1 | Women are equally granted or entrusted equal role for their research or project at the laboratory. | female male | $\begin{aligned} & 2.45 \\ & 1.62 \\ & \hline \end{aligned}$ | $\begin{aligned} & \hline 1.239 \\ & 0.852 \\ & \hline \end{aligned}$ | 3.241 | 0.002 |
|  | 2 | Women equally receive the appraisal or award for the outcome of their project or research. | female <br> male | $\begin{aligned} & 2.53 \\ & 1.35 \end{aligned}$ | $\begin{aligned} & 1.261 \\ & 0.629 \end{aligned}$ | 5.030 | 0.000 |
|  | 3 | The strictness, objectiveness and importance of the research outcome are equally respected regardless of the sex of the person in charge | female <br> male | $\begin{aligned} & 2.35 \\ & 1.38 \end{aligned}$ | $\begin{aligned} & 1.331 \\ & 0.637 \end{aligned}$ | 3.944 | 0.000 |
|  | 4 | Dealing with the funding donors (those providing funding for the project) in terms of administrative or budget process of the research project is equally fair regardless of the sex of the applicant | female <br> male | 2.38 1.50 | 1.353 0.812 | 3.281 | 0.002 |
|  | 5 | Women receive the same social evaluation and respect to men as scientists or engineers (by their colleagues, professor, funding donors, academic association, scientific society etc) | female <br> male | 3.33 1.85 | $\begin{aligned} & 1.492 \\ & 1.084 \end{aligned}$ | 4.657 | 0.000 |
|  | 6 | Marriage, pregnancy or child care have the same effect on scientists/engineers regardless of their sex for their study, research or project performance. | female male | 3.08 2.31 | 1.685 1.320 | 2.066 | 0.043 |
|  | 7 | Female students in STEM are intimidated in the laboratory or in classes because they are female. | female male | $\begin{aligned} & 2.95 \\ & 2.65 \end{aligned}$ | $\begin{aligned} & 1.467 \\ & 1.623 \end{aligned}$ | 0.768 | 0.445 |
|  |  | Average | female male | $\begin{aligned} & \hline 2.72 \\ & 1.81 \\ & \hline \end{aligned}$ | $\begin{aligned} & \hline 0.966 \\ & 0.606 \\ & \hline \end{aligned}$ | 4.717 | 0.000 |

The questions are evaluated on a Likert-type scale (5 points).

1. Perception of Gender Barriers : Higher score means higher perception of gender barriers in STEM
2. Direct/Indirect Experience of Gender Barriers : Higher score means more experiences of gender barrier in STEM

For the same questions, different answering set was provided to the respondents depending on their sex.
-Female respondent : 1. Never experienced, seen nor heard from others, 2. Neither seen nor heard but recognize the possibility, 3. Heard from others, 4. I have seen others experience, 5. Experienced for myself.
-Male respondent : 1. Never experienced, seen nor heard from others, 2. Neither seen nor heard but recognize the possibility, 3. Heard from others about unknown person's case, 4. Heard from my colleague or known person's experience, 5. I have seen someone experience
3. Career Outlook for Women in STEM : Higher score means more positive prospect (reverse coded)
4. Need for policy to overcome 'gender barriers' : Higher score means more agreement (reverse coded)

5 Perception of Gender Role Stereotype: The higher the score, the more progressive attitude towards gender role stereotype
6. Perception of Gender Equity : Higher score means higher perception or understanding of gender equity
7. Perception of Gender Equality for study \& research environment : Higher score means higher perception

## Appendix 3. Analyses of Variables by individual questions (APNN)

Similar to 4.2.2, the two way ANOVA results for individual questions are summarized in table format. A significant effect of either major field or current status or both on the individual questions are shown as $p$ values in the tables of "Analyses of Variables for Question $x-y$ (where $x$ indicates the sub-area and y the question number under the sub-area)." A $p$ value less than 0.05 is considered statistically significant. For example, if $p$ value is less than 0.05 for major field, this means that the major field has a significant effect on the scores for the individual question for the particular sex (female or male). Similar interpretation can be made for current status. For major field * current status, a $p$ value of less than 0.05 would mean a significant interaction effect. The cells that are highlighted are those which show $p$ value less than 0.05 .

For each question, figures showing comparative scores for the participating countries are presented. The blue bars represent results from female respondents while the red bars from male.

1-1) Girls and boys are equally encouraged to choose their majors in STEM during their education period.

## Appendix 4. Analyses of Variables by individual questions (ARN)

Similar to 4.3.2, the 2 way ANOVA results for individual questions are summarized in table format. A significant effect of either major field or current status or both on the individual questions are shown as $p$ values in the tables of "Analyses of Variables for Question $x-y$ (where $x$ indicates the sub-area and $y$ the question number under the sub-area)." A $p$ value less than 0.05 is considered statistically significant. For example, if $p$ value is less than 0.05 for major field, this means that the major field has a significant effect on the scores for the individual question for the particular sex (female or male). Similar interpretation can be made for current status. For major field $*$ current status, a $p$ value of less than 0.05 would mean a significant interaction effect. The cells that are highlighted are those which show $p$ value less than 0.05 .

For each question, figures showing comparative scores for the participating countries are presented. The blue bars represent results from female respondents while the red bars from male.

1-1) Girls and boys are equally encouraged to choose their majors in STEM during their education period.

# Appendix 5. Email sent to APNN and ARN members for Survey 

\author{

1) Email sent to APNN members
}

June 15, 2018

Dear APNN members,

We at the Association of Korean Woman Scientists and Engineers (KWSE) thank you for your cooperation over the past years in the international joint survey. We kindly ask that your organization participate again in this year's international survey among APNN member countries. Unlike previous years, however, this year's survey will be conducted among "young male and female scientists and/or engineers, born between 1988 and 1998." We ask that at least 100 male and 100 female respondents affiliated with your organization participate in the survey by filling up the attached questionnaire sheets. Please send us the raw sheets with summary of the survey no later than by July 31st, 2018 by e-mail to kwse@kwse.or.kr or by surface mail to \#801 National Nanofab Center, 291 Daehak-ro, Yuseong-gu Daejeon, Korea 305-338. You or your members can alternatively participate by responding to the online version of this survey which is being prepared and will be notified within a week or two. Please make sure that each person only participate once either online or offline, and not both.

This year's theme is identical to last year's, which is "gender barriers in STEM in Asia and the Pacific." Your cooperation will be crucial in constructing a report on the APNN countries. We are fortunate to have received funding from the Korean government for this project which is managed by KWSE. As we did last year, we will be reimbursing you or your organization for expenses up to 500,000 KWon (equivalent to about 450 USDollars). We may also ask for reports for which we may send you an honorarium of $300,000 \mathrm{KWon}$ (about 270 USDollars) to $500,000 \mathrm{KWon}$ (about 450 USDollars) depending on the content and length.

Please note that the report from this survey is separate from the annual APNN country report.
We look forward to hearing from you at your earliest convenience and thank you for your participation and cooperation. Please do not hesitate to contact KWSE (kwse@kwse.or.kr) or myself (iskimdsu(o)gmail.com) for any questions you may have.

Yours sincerely,

Jung Sun Kim, Ph.D.
Vice President
\& Chair of the KWSE International Network Committee

## Guidelines for Survev

You are kindly asked to prepare your report based on the attached questionnaire. Due to the amount of work that needs to be put in, KWSE will be supporting your task with a modest honorarium for each task.
I. Conduct survey
A. The file "questionnaire (2018APNN)" is a six page questionnaire that should be collected from young female and male scientists and engineers born between 1988-1998, affiliated with your organization. We are asking for as many participants as possible (at least 100 members of each gender). Male scientists and/or engineers from your country could participate online through the link which will be notified soon. The survey should be conducted by "young male scientists and/or engineers," who are students or graduates of natural science or engineering majors of 19~30 years of age.
B. We ask that you send us the raw data and collate the results. However, you do not need to collate results for those who have participated online; we will let you know how many people from your country participated online later.
C. Depending on the number of surveys conducted, you will be reimbursed for expenses up to $500,000 \mathrm{KW}$ (about 450 USDollars, depending on exchange rate) or more depending on the funding availability.
II. The results of the surveys will be compiled into a printed report and sent to related organizations (including UNESCO) and your organization before the year end.

# 2) Email sent to ARN members 

June 15, 2018

Dear Dr. Caroline Langat Thoruwa,

We at the Association of Korean Woman Scientists and Engineers (KWSE) kindly ask that organizations of ARN participate in this year's international survey. This year's survey will be conducted among "young male and female scientists and/or engineers, born between 1988 and 1998." We ask that at least 100 male and 100 female respondents affiliated with your organization participate in the survey by filling up the attached questionnaire sheets. Please send us the raw sheets with summary of the survey no later than by July 31st, 2018 by e-mail to kwse $@$ kwse.or.kr or by surface mail to \#801 National Nanofab Center, 291 Daehak-ro, Yuseong-gu Daejeon, Korea 305-338. You or your members can alternatively participate by responding to the online version of this survey which is being prepared and will be notified within a week or two. Please make sure that each person only participate once either online or offline, and not both.

This year's theme is identical to that which has been conducted among APNN countries last year, which is "gender barriers in STEM." Your cooperation will be helpful in constructing a report on the APNN countries in cooperation with African countries. We are fortunate to have received funding from the Korean government for this project which is managed by KWSE. As we did last year, we will be reimbursing you or your organization for expenses up to $500,000 \mathrm{KWon}$ (equivalent to about 450 USDollars). We may also ask for reports for which we may send you an honorarium of $300,000 \mathrm{KWon}$ (about 270 USDollars) to $500,000 \mathrm{KWon}$ (about 450 USDollars) depending on the content and length.

We look forward to hearing from you at your earliest convenience and thank you for your participation and cooperation. Please do not hesitate to contact KWSE (kwse@kwse.or.kr) or myself (jskimdsu(@mail.com) for any questions you may have.

Yours sincerely,

Jung Sun Kim, Ph.D.
Vice President
\& Chair of the KWSE International Network Committee

## Guidelines for Survev

    e) Perception of Gender Equity
    ${ }^{\text {f) }}$ Perception of Gender Stereotype
    g) Perception of Gender Barriers for the study and research environment in STEM
    ${ }^{\text {h) }}$ Excluding data from Malaysia and India. In other tables APNN average includes both Malaysia and India.
    ${ }^{i}$ ) Welchi test, as robust ANOVA was applied to analyze the differences between countries, according to variable sample sizes by country.

[^1]:    ${ }^{\text {a) }}$ Taiwan's data were determined by the Taiwanese government based on the UNDP and WEF methodology.
    (source: http://eng.stat.gov.tw/ct.asp?xItem=25280\&ctNode=6032\&mp=5)
    ${ }^{\text {b }}$ ) Taiwan's data are not included in the average calculation.

[^2]:    1) Most of the respondents classified in 'others' group as current status was deemed to be working and studying after their study in STEM.
[^3]:    1) Note that this is based on the $30.2 \%$ of the respondents who indicated their age. $69.8 \%$ did not.
    2) Most of the respondents classified in 'others' group as current status was deemed to be working and studying after their study in STEM.
[^4]:    1) Average age is based on those that indicated their age. $69.8 \%$ from ARN did not and thus is not
[^5]:    1) Unlike APNN countries, nationalities of all respondents from ARN countries were from the respective
[^6]:    1) "Gender equality, equality between men and women $\cdots$ does not mean that women and men have to become the same, but that their rights, responsibilities and opportunities will not depend on whether they were born male or female. Gender equity means fairness of treatment for men and women according to their respective needs. This may include equal treatment or treatment that is different but which is considered equivalent in terms of rights, benefits, obligations, and opportunities." (by United Nations Educational, Scientific and Cultural Organization). We also understand the concept of equity from "The route to achieving equity will not be accomplished through treating everyone equally. It will be achieved by treating everyone just according to their circumstance" (Paula Dressel, Race Matters Institute).
    2) The historical long invisibility or insufficient appraisal for women in STEM is now well known subject. UNESCO estimate the share of female researcher worldwide at $28.4 \%$, but $22.5 \%$ for Southest Asia, and $16.9 \%$ for South Asia in 2013 or closest year. The share of female for education, working, research and decision making status was continuously increased but there exist sticky barrier which make unable the gender equality in STEM such as maternal wall/glass ceiling/performance evaluation criteria, lack of recognition, lack of support for leadership bids, unconscious gender bias (UNESCO Science Report: toward 2030, 2015).
[^7]:    1) "Gender equality, equality between men and women $\cdots$ does not mean that women and men have to become the same, but that their rights, responsibilities and opportunities will not depend on whether they were born male or female. Gender equity means fairness of treatment for men and women according to their respective needs.
